

"Yeast identification", "Dermatophyte identification", "Major monomorphic pathogenic fungi and actinomycetes" and "Dimorphic systemic pathogens". Although there are only five plates the handbook is well illustrated with simple line drawings showing the microscopic features of the fungi described. In common with some other American writers the authors use a technical jargon that I find unnecessary and at times irritating. The term dimorphic is well used to emphasise that some fungal pathogens have more than one growth form: it is in this handbook that I have first seen use of the term monomorphic. In adopting the term blastoconidia the authors appear uncritical and too respectful of the views of academic taxonomists who apply the descriptive principles of conidium ontogeny to the vegetative cells of yeasts.

There is a good index and a useful appendix giving details of stains and culture media. There are bibliographies dealing with the fungi in general, classification and medical mycology, but these are open to the criticism that too great a prominence is given to other manuals and text books that may be less readily available than original papers in established journals.

With the CDC Laboratory Manual for Medical Mycology published by the US Department of Health, Education, and Welfare Public Health Service out to print, this Medical Mycology Handbook is recommended to medical technologists as one of the best available. It is reasonably priced and is in a spiral binding with thin board covers.

Microbial testers—probing carcinogenesis

Edited by I. C. FELKNER. 1981. Microbiology series, vol. 5. Marcel Dekker Inc., New York. Pp. xv and 264. SwF95.00.

This book is designed for scientists interested in genetic toxicology, oncology, teratology, and environmental protection monitoring. It consists of four parts arranged to lead the reader from consideration of molecular and cellular mechanisms to the rationale and design of microbiological assays and their inherent problems. Finally, their application under practical conditions in the study of the role of dietary factors in human and animal cancer is described. This is covered in 10 chapters by different authors; as is common in this type of compilation, this leads to a certain amount of unevenness and repetition.

The marked increase in interest in microbiological mutagenesis tests in the last decade has arisen partly from attempts to establish them as short-term tests for carcinogens to replace tedious and expensive classical animal tests. As perhaps could have been anticipated, it is now clear that no single short-term test is likely to achieve this end. While it now appears that virtually all known carcinogens can be shown by appropriate tests to possess mutagenic, DNA-damaging, or DNA-modifying attributes, the reverse is not generally true. Compounds that are mutagens but that have not been shown to be carcinogens in man or animals are now recognised. Also, because short-term tests can be done quickly, this has already led to the situation in which more than a few compounds have been studied extensively in short-term tests but have not been adequately tested for carcinogenicity in animal models. For this reason, the number of "false positives" is liable to decrease as animal tests are repeated and extended. The high sensitivity of most microbiological tests may mean, however, that they are in fact ultra-sensitive *in-vitro* carcinogenesis. In animal studies it is commonly found that the latent period for the appearance of tumours is strongly dose-dependent, implying that the failure to induce tumours with a small dose of a carcinogen may simply mean that the corresponding latent period is longer than the natural lifespan of the animal. Moreover, the capacity for DNA repair has been deleted from most microbiological tester organisms to improve their efficiency in detecting mutations. From the practical point of view, "false negatives" are more serious. At least some of the substances in this category exert their effects at the chromosomal level, and therefore cannot be detected in tests with procaryotes. Much ingenuity has been used to devise tests in eucaryotes, yeasts and fungi as well as mammalian cells in culture, to overcome this problem.

This book provides a useful overview of progress in this field and considerable food for thought at the conceptual and the practical levels. Some of the methods described are already well established and enjoy widespread use in genetic toxicology testing; their use for the detection of carcinogens is still at the experimental stage, the results of which must be treated with
