Polyomaviruses and Human Diseases Nasimul Ahsan, 2007-06-25 Science never solves a problem without creating ten more George Bernard Shaw How prophetic the above words prove to be when applied to the advances of 20th century medicine Prior to Banting and Best clinicians were unaware of the ravages of diabetes patients simply wasted away and died Following the purification of insulin clinicians now had to deal with diabetic retinopathy diabetic nephropathy and all the other complications of long term diabetes A little over 50 years ago the first successful human kidney transplant was performed in Boston The first 30 years of the experience had successes when compared to the alternative but were a constant struggle to get even 50% of the grafts from deceased donors to survive more than a year However the science continued to advance knowledge of the immune response With this came more and increasingly powerful tools for the clinician Suddenly success rates of 80-90% at one year were attainable With this success came new problems new complications and clinicians now had to worry about the long term consequences of their therapy as patients were surviving with functional grafts for extended periods A particular infectious complication evolved with the application of ever more powerful immunosuppressant drugs Astute clinicians noted that occasionally cellular rejections seemed to get worse with steroids Despite their best efforts and the use of powerful drugs patients lost their grafts to overwhelming interstitial infiltrates not seen before **Steroid Hormone Resistance** George P. Chrousos, D. Lynn Loriaux, Mortimer B. Lipsett, 2012-12-06 This volume represents the first attempt to present in one place the clinical syndromes and the pathophysiologic basis for the resistance states to each of the classes of steroid hormones Glucocorticoids mineralocorticoids androgens estrogens progesterone and vitamin D have widely diverse roles ranging from the control of homeostasis to reproduction and bone formation They are similar in that they share a chemical structure and that their action is in the cell nucleus where they induce transcription of specific genes leading to synthesis of function specific proteins Clinical

syndromes of steroid hormone resistance to androgens complete and partial testicular feminization aldosterone pseudo hypoaldosteronism and vitamin D vitamin D dependent rickets type II have been known for many years Progesterone and glucocorticoid resistance syndromes have been described only recently Resistance to estrogens has not been reported in man or in animals It is hoped that a detailed reexamination of what is known about each of these conditions at the clinical and molecular levels will enhance our understanding of the function of these hormones and their mechanisms of action New insight and research initiatives should result G P Chrousos D L Loriaux M B Lipsett vii ACKNOWLEDGMENTS The contents of this volume are based in part on the proceedings of an International Conference held in Bethesda in the summer of 1984 This conference was sponsored by the National Institute of Child Health and Human Development Bethesda Maryland
