Microenvironmental Aspects Of Immunity:

Microenvironmental Aspects of Immunity B. Jankovic, 2012-12-06 Investigation of the morphology and function of lymphatic tissue evolved rapidly during the past few years. Many new aspects and dimensions have proved to be of great significance for the understanding of processes which are triggered by immunological means. The cellular coordination that operates in immune response emphasizes again the importance of immunologic relations in the lymphatic tissue. It has become obvious that both the morphologic and the molecular properties of lymphatic cells are essential for their functional expression. Furthermore, the emerging body of evidence clearly shows that nonlymphatic cells e.g. reticular cells and neurons and substances that exert neurohumoral and hormonal activities should be regarded as normal constituents of the microenvironment of lymphatic tissue. The immune phenomena are therefore direct derivatives of processes that occur in this microenvironment. Such a view of the microenvironment of immunity calls for immunoendocrinologic, immunoneurologic and immunopharmacologic projects; it stimulates the creative imagination and encourages research workers to enter into unexplored areas of the immunosciences. This book illustrates the joint efforts made by scientists from various parts of the world and armed with different ideas and views to solve some of the mysteries of lymphatic tissue microenvironment. The Fourth Conference took place in the lovely setting of Dubrovnik and in the shade of olive trees under which philosophers used to meditate in ancient times. For five days from June 26 to 30, 1972, more than 250 scientists participated in the morning and afternoon plenary sessions. Specific attention was devoted to eight fundamental areas of immunobiology. The papers of many immunologists were supplemented by two special afternoon lectures given by Drs. D. C. Dumonde and J. B. Solomon. The chairmen had a difficult and responsible task in selecting the most interesting from among the large number of excellent papers submitted. They organized and ensured the successful functioning of sessions and reported the session highlights to all participants.

Cancer Plasticity and the Microenvironment: Implications for Immunity and Therapy Response

Petranel T. Ferrao, Erik W. Thompson, Andreas Behren, Robin L. Anderson, 2019-11-01 Cancer cells can change and adapt especially within the host environment, a phenomenon known as cancer plasticity. Several factors including the immune system can influence and be influenced by cancer plasticity, which in turn can impact upon patient responses to treatment. As such, we currently face several challenges for implementing combination therapies as effective cancer treatment strategies. We have compiled a topic with a number of articles that emphasize the various aspects of cancer plasticity, describing in particular the important role of the tumor microenvironment. As we embark on a new era of precision medicine with multimodal therapies for improving patient outcomes, this topic highlights some relevant points for consideration that are pertinent to the incorporation and effective use of new treatments as part of cancer treatment regimens, including immune modulating drugs.

Implications of Immune Landscape in Tumor Microenvironment

Selvarangan Ponnazhagan, Juana Serrano Lopez, Somchai Chutipongtanate, 2024-10-01 Tumor microenvironment (TME) plays an important

role in immunosuppressive mechanisms that result in immune editing and treatment resistance. Elucidating the diversity of stromal and immune cell distribution, polarization and changes in their gene expression signatures will enable a better understanding of key events to improve treatment and prognosis. With the onset of immune checkpoint inhibitors (ICIs) in clinics for patients with solid tumors and hematologic malignancies, immunotherapy has taken a new direction in cancer management, especially as combination therapies. However, limitations encountered with the use of ICIs, including toxicity and immune-related adverse events (irAE), indicate the need to understand multiple regulatory mechanisms at both cellular and molecular levels that alter the immune landscape of the TME. Since predominant changes in the immune landscape occur at the TME, focussed deliberation on these events will provide a comprehensive understanding on this topic for scientists in the fields of basic translational and clinical cancer immunology. The heterogeneity of TME and complex immune landscape pose major challenges in the treatment of solid tumors. Thus, integrative approaches which relate immune mechanisms in the TME to that of peripheral and systemic immune signatures are essential to improve our understanding of the disease complexity and possibly improve immunotherapy outcomes. Such multiparametric studies should combine advances in current understanding of cancer immunobiology with powerful technologies such as single cell and spatial transcriptomics and high dimensional flow cytometry that rapidly expand our ability to explore these interactions. Notably, tumor heterogeneity and inflammatory mediators in the TME vary significantly in neoplasms based on mutational load, lymphocyte infiltration, expression of checkpoint molecules, soluble inhibitors and tumor cell metabolism. Overall, connecting key events to immune signatures that conform to a consensus will provide a benchmark to delve further into this important topic. Other parameters such as myeloid and lymphoid cell polarization to alter the immune homeostasis at the TME, favoring a tumor supportive milieu, would provide a macroscopic picture that may help guide treatment choices for more refined personalized tumor immunotherapy.

Metabolic and Senescence Characteristics Associated with the Immune Microenvironment in Tumor Cells Yewei Zhang, Houjuan Zhu, Qun Zhao, Chenyu Sun, 2024-04-11. A common feature of cancer metabolism is the ability to obtain essential nutrients from a nutrient poor environment and use them to maintain viability as well as generate new biomass. Alterations in intracellular and extracellular metabolites can be accompanied by tumor associated metabolic reprogramming with profound effects on gene expression, cell differentiation and tumor microenvironment. In these cases, the metabolic microenvironment of the tumor itself can present an immunosuppressive environment that needs to be overcome. Specifically, it will help maximize the efficacy of cancer therapies by identifying targets that suppress or alter cancer metabolism to improve the tumor microenvironment, nutrient availability or that modulate immune metabolism to bolster inflammation.

Innate and Adaptive Immunity in the Tumor Microenvironment Eitan Yefenof, 2007-12-20. Cancer cells are continuously interacting with the immune system of the host. These interactions can be regarded as a double edged sword. On the one hand, innate and adaptive immune responses act to protect the host by attempting rejection of the tumor. On the other

hand inflammatory cells and proteins stimulate multiplication and dissemination of cancer cells thereby accelerating the progression of the disease Traditionally the interplay between cancer cells and host immunity has been studied systemically with no particular attention to the site at which a given tumor develops Recent studies however indicate that the tumor microenvironment is unique in providing both supportive and inhibitory factors that determine the fate of the tumor and its host Accordingly microenvironmental immunity that operates inside and around a tumor plays a crucial role in cancer development and progression The aim of the present volume is to compile reviews on innate and adaptive immune responses at the tumor microenvironment with emphasis on positive and negative outcomes that affect the progression of the disease These reviews have been solicited from experts in the field who published original research studies focusing on these issues

Tumor Immune Microenvironment in Cancer Progression and Cancer Therapy Pawel Kalinski,2017-12-22 The tumor microenvironment has become a very important and hot topic in cancer research within the past few years The tumor microenvironment is defined as the normal cells molecules and blood vessels that surround and feed a tumor cell As many scientists have realized studying the tumor microenvironment has become critical to moving the field forward since there are many players in a tumor s localized and surrounding area which can significantly change cancer cell behavior There is a dual relationship wherein the tumor can change its microenvironment and the microenvironment can affect how a tumor grows and spreads Tumor Microenvironment in Cancer Progression and Cancer Therapy aims to shed light on the mechanisms factors and mediators that are involved in the cancer cell environment Recent studies have demonstrated that in addition to promoting tumor progression and protecting tumor cells from the spontaneous immune mediated rejection and different forms of cancer therapeutics tumor microenvironment can also be a target and mediator of both standard and newly emerging forms of cancer therapeutics Thus the dual role of the tumor microenvironment is the integral focus of the volume The volume highlights the bi directional interactions between tumor cells and non malignant tumor component during tumor progression and treatment It also focuses on the three groups of the reactive tumor component stromal cells blood vessels and the infiltrating immune cells These three groups are discussed under the lens of their role in promoting tumor growth shielding the tumor from rejection and from standard forms of cancer therapies They are emerging as targets and mediators of standard and new forms of potential therapy *Research Grants Index* National Institutes of Health (U.S.).
