Microgenetic Approach to the Conscious Mind Talis Bachmann, 2000-11-22 Many secrets of nature have been discovered since we have a better understanding of microstructures for example subatomic spheres in physics and genetic structures in biochemistry This book is set to convey an overview of the history methods findings and theoretical accounts of microgenetic research in consciousness and experimental psychology The reader will find information about how conscious percepts unfold within only a fraction of a second In a sense and according to the microgenetic hypothesis our subjectively experienced perceptual image undergoes formation similar to the process of developing a photograph Yet the time scale of the awareness related perceptual development is much finer and therefore accessible only to observation armed with special experimental procedures that are exposed in this book In addition the author presents empirical findings and theoretical interpretations from his own lab Professor Talis Bachmann has been active in microgenetic research on attention perception and consciousness for more than 25 years Series B

The Evolution of Human Language Wolfgang Wildgen, 2004-06-30 Wolfgang Wildgen presents three perspectives on the evolution of language as a key element in the evolution of mankind in terms of the development of human symbol use 1 He approaches this question by constructing possible scenarios in which mechanisms necessary for symbolic behavior could have developed on the basis of the state of the art in evolutionary anthropology and genetics 2 Non linguistic symbolic behavior such as cave art is investigated as an important clue to the developmental background to the origin of language Creativity and innovation and a population s ability to integrate individual experiments are considered with regard to historical examples of symbolic creativity in the visual arts and natural sciences 3 Probable linguistic fossils of such linguistic innovations are examined The results of this study allow for new proposals for a protolanguage and for a theory of language within a broader philosophical and semiotic framework and raises interesting questions as to human consciousness universal grammar and linguistic methodology Series B

Sisyphus's Boulder Eric Dietrich, Valerie Gray Hardcastle, 2005-02-17

Consciousness lies at the core of being human Therefore to understand ourselves we need a theory of consciousness In Sisyphus s Boulder Eric Dietrich and Valerie Hardcastle argue that we will never get such a theory because consciousness has an essential property that prevents it from ever being explained Consequently philosophical debates over materialism and dualism are a waste of time Scientific explanations of consciousness fare no better Scientists do study consciousness and such investigations will continue to grow and advance However none of them will ever reveal what consciousness is In addition given the centrality of consciousness in philosophy Dietrich and Hardcastle claim that philosophy itself needs to change That the central problems of philosophy persist is actually a profound epistemic fact about humans Philosophy then is a limit to what humans can understand Series A

Memory and Understanding Renate Bartsch,2005-05-09 This book treats memory and understanding on two levels on the phenomenological level of experience on which a theory of dynamic conceptual semantics is built and on the neuro connectionist level which supports the capacities of concept formation remembering and understanding A neuro connectionist circuit architecture of a constructive memory is developed in which understanding and remembering are modelled in accordance with the constituent structures of a dynamic conceptual semantics Consciousness emerges by circuit activation between conceptual indicators and episodic indices with the sensory motor emotional and proprioceptual areas This theory of concept formation remembering and understanding is applied to Proust s *A la recherche du temps perdu* with special attention to the author s excursions into philosophical and aesthetic issues Under this perspective Proust s work can be seen as an artistic exploration into our capacity of understanding whereby the unconscious the memory is exteriorized in consciousness by presenting the experienced episodes in the conceptual order of similarity and contiguity through our capacity of concept formation Series A

Psychological Concepts and Biological Psychiatry Peter Zachar,2000 This interdisciplinary work addresses the question What role should psychological conceptualization play for thinkers who believe that the brain is the organ of the mind It offers readers something unique both by systematically comparing the writings of eliminativist philosophers of mind with the writings of the most committed proponents of biological psychiatry and by critically scrutinizing their shared anti anthropomorphism from the standpoint of a diagnostician and therapist Contradicting the contemporary assumption that common sense psychology has already been proven futile and we are just waiting for an adequate scientifically based replacement this book provides explicit philosophical and psychological arguments showing why if they did not already have both cognitive and psychodynamic psychologies philosophers and scientists would have to invent them to better understand brains Series A

The Development of Implicit and Explicit Memory Carolyn K. Rovee-Collier,Harlene Hayne,Michael Colombo,2001-01-01 This is the only book that examines the theory and data on the development of implicit and explicit memory It first describes the characteristics of implicit and explicit memory including conscious recollection and tasks used with adults to measure them Next it reviews the brain mechanisms thought to underlie implicit and explicit memory and the

studies with amnesics that initially prompted the search for different neuroanatomically based memory systems Two chapters review the Jacksonian first in last out principle and empirical evidence for the hierarchical appearance and dissolution of two memory systems in animal models rats nonhuman primates children and normal amnesic adults Two chapters examine memory tasks used with human infants and evidence of implicit and explicit memory during early infancy Three final chapters consider structural and processing accounts of adult memory dissociations their applicability to infant memory dissociations and implications of infant data for current concepts of implicit and explicit memory Series B Beyond Dissociation Yves Rossetti, Antti Revonsuo, 2000 Analysis and dissociation have proved to be useful tools to understand the basic functions of the brain and the mind which therefore have been decomposed to a multitude of ever smaller subsystems and pieces by most scientific approaches However the understanding of complex functions such as consciousness will not succeed without a more global consideration of the ways the mind brain works This implies that synthesis rather than analysis should be applied to the brain The present book offers a collection of contributions ranging from sensory and motor cognitive neuroscience to mood management and thought which all focus on the dissociation between conscious explicit and nonconscious implicit processing in different cognitive situations The contributions in this book clearly demonstrate that conscious and nonconscious processes typically interact in complex ways The central message of this collection of papers is In order to understand how the brain operates as one integrated whole that generates cognition and behaviour we need to reassemble the brain and mind and put all the conscious and nonconscious pieces back together again Series B

Behavioral Methods in Consciousness Research Morten Overgaard, 2015-03-26 The past two decades have seen a surge of interest in the topic of consciousness with the result that the research literature has expanded greatly However until now there has been little consensus on just which methods are the most effective for the study of consciousness As a result a wide range of experimental paradigms have been employed sometimes making it difficult to compare and contrast experimental findings Behavioral Methods in Consciousness Research is the first book of its kind providing an overview of methods and approaches for studying consciousness The chapters are written by leading researchers and experts who describe the methods they actually use in their own studies along with their pitfalls problems and difficulties For all students and researchers embarking on research in this area and even seasoned researchers this book is a valuable source of information in helping them design perform and analyze scientifically rigorous experiments **The Caldron of Consciousness** Ralph D. Ellis, Natika Newton, 2000-01-01 These new studies by prominent neuroscientists psychologists and philosophers work toward a coherent framework for understanding emotion and its contribution to the functioning of consciousness in general as an aspect of self organizing embodied subjects Distinguishing consciousness from unconscious information processing hinges on the role of motivating emotions in all conscious modalities and how emotional brain processes interact with those traditionally associated with cognitive function Computationally registering processing sensory

signals e.g. in the occipital lobe or area V4 by itself does not result in perceptual consciousness which requires subcortical structures such as amygdala, hypothalamus and brain stem. This interdisciplinary anthology attempts to understand the complexity of emotional intentionality, why the role of motivation in self-organizing processes is crucial in distinguishing conscious from unconscious processes, how emotions account for agency and how an adequate approach to emotion motivation can address the traditional mind-body problem through a holistic understanding of the conscious behaving organism.

Series B **Consciousness Emerging** Renate Bartsch, 2002-01-01. This study of the workings of neural networks in perception and understanding of situations and simple sentences shows that and how distributed conceptual constituents are bound together in episodes within an interactive dynamic architecture of sensorial and pre-motor maps and maps of conceptual indicators, semantic memory and individuating indicators, historical episodic memory. Activation circuits between these maps make sensorial and pre-motor fields in the brain function as episodic maps creating representations which are expressions in consciousness. It is argued that all consciousness is episodic, consisting of situational or linguistic representations and that the mind is the whole of all conscious manifestations of the brain. Thought occurs only in the form of linguistic or image representations. The book also discusses the role of consciousness in the relationship between causal and denotational semantics and its role for the possibility of representations and rules. Four recent controversies in consciousness research are discussed and decided along this model of consciousness. Is consciousness an internal or external monitoring device of brain states? Do all conscious states involve thought and judgement? Are there different kinds of consciousness? Do we have a one-to-one correspondence between certain brain states and conscious states? The book discusses also the role of consciousness in the relationship between causal and denotational semantics and its role for the possibility of representations and rules.

Series A *The Constitution of Phenomenal Consciousness* Steven M. Miller, 2015-06-15. Philosophers of mind have been arguing for decades about the nature of phenomenal consciousness and the relation between brain and mind. More recently, neuroscientists and philosophers of science have entered the discussion. Which neural activities in the brain constitute phenomenal consciousness and how could science distinguish the neural correlates of consciousness from its neural constitution? At what level of neural activity is consciousness constituted in the brain and what might be learned from well-studied phenomena like binocular rivalry, attention, memory, affect, pain, dreams and coma? What should the science of consciousness want to know and what should explanation look like in this field? How should the constitution relation be applied to brain and mind and are other relations like identity, supervenience, realization, emergence and causation preferable? Building on a companion volume on the constitution of visual consciousness, AiCR 90, this volume addresses these questions and related empirical and conceptual territory. It brings together for the first time scientists and philosophers to discuss this engaging interdisciplinary topic.

Mental States and Conceptual Worlds Jason Brown, 2019-03-22. An account of perception is essential for an interpretation of memory, thought and the mental state. The

theory expounded in this book developed from clinical studies of brain damaged individuals is a dynamic process account that departs from static computational models of the mind with implications for our understanding of all aspects of mental function including the mind brain problem The various topics are discussed in lengthy essays that cover such phenomena as imagery reality and illusion time and the present moment subjectivity will and agency and psychoanalysis and group psychology Investigating Phenomenal Consciousness Max Velmans,2000-01-01 How can one investigate phenomenal consciousness As in other areas of science the investigation of consciousness aims for a more precise knowledge of its phenomena and the discovery of general truths about their nature This requires the development of appropriate first person second person and third person methods This book introduces some of the creative ways in which these methods can be applied to different purposes e g to understanding the relation of consciousness to brain to examining or changing consciousness as such and to understanding the way consciousness is influenced by social clinical and therapeutic contexts To clarify the strengths and weaknesses of different methods and to demonstrate the interplay of methodology and epistemology the book also suggests a number of maps of the consciousness studies terrain that place different approaches to the study of consciousness into a broader interdisciplinary context Series A **Bibliographic Index** ,2001

Experimental Design Research Philip Cash,Tino Stanković,Mario Štorga,2016-05-17 This book presents a new multidisciplinary perspective on and paradigm for integrative experimental design research It addresses various perspectives on methods analysis and overall research approach and how they can be synthesized to advance understanding of design It explores the foundations of experimental approaches and their utility in this domain and brings together analytical approaches to promote an integrated understanding The book also investigates where these approaches lead to and how they link design research more fully with other disciplines e g psychology cognition sociology computer science management Above all the book emphasizes the integrative nature of design research in terms of the methods theories and units of study from the individual to the organizational level Although this approach offers many advantages it has inherently led to a situation in current research practice where methods are diverging and integration between individual team and organizational understanding is becoming increasingly tenuous calling for a multidisciplinary and transdisciplinary perspective Experimental design research thus offers a powerful tool and platform for resolving these challenges Providing an invaluable resource for the design research community this book paves the way for the next generation of researchers in the field by bridging methods and methodology As such it will especially benefit postgraduate students and researchers in design research as well as engineering designers On Becoming Aware Natalie Depraz,Francisco J. Varela,Pierre Vermersch,2003 This book searches for the sources and means for a disciplined practical approach to exploring human experience The spirit of this book is pragmatic and relies on a Husserlian phenomenology primarily understood as a method of exploring our experience The authors do not aim at a neo Kantian a priori new theory of experience but instead they

describe a concrete activity how we examine what we live through how we become aware of our own mental life The range of experiences of which we can become aware is vast all the normal dimensions of human life perception motion memory imagination speech everyday social interactions cognitive events that can be precisely defined as tasks in laboratory experiments e g a protocol for visual attention but also manifestations of mental life more fraught with meaning dreaming intense emotions social tensions altered states of consciousness The central assertion in this work is that this immanent ability is habitually ignored or at best practiced unsystematically that is to say blindly Exploring human experience amounts to developing and cultivating this basic ability through specific training Only a hands on non dogmatic approach can lead to progress and that is what animates this book Series B

Consciousness Recovered George Mandler, 2002-01-01 This integrated approach to the psychology of consciousness arises out of Mandler's 1975 paper that was seminal in starting the current flood of interest in consciousness The book starts with this paper followed by a novel psychological evolutionary theoretical discussion of consciousness and then a historically oriented presentation of relevant functions of consciousness from memory to attention to emotion drawing in part on Mandler's publications between 1975 and 2000 The manuscript is controversial it is outspoken and often judgmental The book does not address speculations about the neurophysiological brain bases of consciousness arguing that these are premature and it is highly critical of philosophical speculations often ungrounded in any empirical observations In short it is a psychological approach pure and simple

Spatial Cognition Seán Ó Nualláin, 2000 Spatial Cognition brings together psychology computer science linguistics and geography discussing how people think about space our internal cognitive maps and spatial perception and how we communicate about space for instance giving route directions or using spatial metaphors The technological applications adding dynamism to the area include computer interfaces educational software multimedia and in car navigation systems On the experimental level themes as varied as gender differences in orientation and of course wholly unrelated the role of the hippocampus in rodent navigation are described Much detailed analysis and computational modeling of the structure of short term memory STM is discussed The papers were presented at the 1998 annual meeting of the Cognitive Science Society of Ireland Mind III Series B

Neural Basis of Consciousness Naoyuki Osaka, 2003 Recent advances in cognitive neuroscience make possible an understanding of the neural events that are associated with different forms of consciousness To fully understand and unveil the mystery of consciousness inside the brain we require examination of the concept of neural basis of conscious mind This book provides a systematic exploration of consciousness and gives an overview of neural and quantum basis of conscious mind through careful explanation of proposed models and extends these theories challenging some generalised views on consciousness Each chapter provides a review of the findings and theoretical accounts related to neural basis of consciousness and the mechanisms of the different varieties of consciousness Professor Naoyuki Osaka Kyoto University has been active in experimental research on consciousness and attention for more than 15 years Series B
