Advances in Space Biology and Medicine S.L. Bonting, 1999-12-20 During the past several years there has been a shortage of flight opportunities for biological and medical projects And those that were available usually had severe restrictions on instrumentation number of subjects duration time allotted for performing the experiments a possibility for repetition of experiments It is our hope and expectation that this will change once the international Space Station is in full operation The advantages of a permanent space station already demonstrated by the Russian Mir station are continuous availability of expert crew and a wide range of equipment possibility of long term experiments where this is warranted increased numbers of subjects through larger laboratory space proper controls in the large 1 G centrifuge easier repeatability of experiments when needed The limited number of flight opportunities during recent years probably explains why it has taken so long to acquire a sufficient number of high quality contributions for this seventh volume of Advances in Space Biology and Medicine While initially the series was issued at annually appearing volumes we are now down to a biannual appearance Hopefully it will be possible to return to annual volumes in the future when results from space station experimentation at beginning to pour in The first three chapters of this volume deal with muscle Fejtek and Wassersug provide a survey of all studies on muscle of rodents flown in space and include an interesting demography of this aspect of space research Riley reviews our current knowledge of the effects of long term spaceflight and re entry on skeletal muscle and considers the questions still to be answered before we can be satisfied that long term space missions such as on the space station can be safely undertaken Stein reviews our understanding of the nutritional and hormonal aspects of muscle loss in spaceflight and concludes that the protein loss in space could be deleterious to health during flight and after return Strollo summarizes our understanding of the major endocrine systems on the ground then considers what we know about their functioning in space concluding that there is much to be learned about the changes taking place during spaceflight The many problems of providing life support oxygen regeneration and food supply during extended stay on the Moon on Mars or in space by means of plant cultivation are discussed by Salisbury The challenges of utilizing electrophoresis in microgravity for the separation of cells and proteins are illustrated and explained by Bauer and colleagues Finally the chapter on teaching of space life sciences by Schmitt shows that this field of science has come of age but also that its multidisciplinary character poses interesting challenges to teaching it

NASA Strategic Plan United States. National Aeronautics and Space Administration, 1994 Scientific Ballooning ,1961 Fundamental Physics in Space ,1999 *Astrobiology* Gerda Horneck, Christa Baumstark-Khan, 2012-12-06 How did life originate in the universe How did it all start after the creation of matter and the formation of elements in the stars What are the pathways from the first organic molecules in space to the evolution of complex life forms on Earth and perhaps elsewhere And how will it all end The Universe itself sets the stage for the very interdisciplinary field of astrobiology that attempts to answer such questions the central one being What is the

cosmic recipe for life Currently there are only very few known elements in this vast mosaic This book bridges a gap in the literature by bringing together leading specialists from different backgrounds who lecture on their fields with close relevance to astrobiology providing tutorial accounts that lead all the way to the forefront of research The book will thus be useful for students lecturers and reseachers alike

**Recapturing a Future for Space Exploration** National Research Council,Division on Engineering and Physical Sciences,Aeronautics and Space Engineering Board,Space Studies Board,Committee for the Decadal Survey on Biological and Physical Sciences in Space,2012-01-30 More than four decades have passed since a human first set foot on the Moon Great strides have been made in our understanding of what is required to support an enduring human presence in space as evidenced by progressively more advanced orbiting human outposts culminating in the current International Space Station ISS However of the more than 500 humans who have so far ventured into space most have gone only as far as near Earth orbit and none have traveled beyond the orbit of the Moon Achieving humans further progress into the solar system had proved far more difficult than imagined in the heady days of the Apollo missions but the potential rewards remain substantial During its more than 50 year history NASA s success in human space exploration has depended on the agency s ability to effectively address a wide range of biomedical engineering physical science and related obstacles an achievement made possible by NASA s strong and productive commitments to life and physical sciences research for human space exploration and by its use of human space exploration infrastructures for scientific discovery The Committee for the Decadal Survey of Biological and Physical Sciences acknowledges the many

achievements of NASA which are all the more remarkable given budgetary challenges and changing directions within the agency. In the past decade however a consequence of those challenges has been a life and physical sciences research program that was dramatically reduced in both scale and scope with the result that the agency is poorly positioned to take full advantage of the scientific opportunities offered by the now fully equipped and staffed ISS laboratory or to effectively pursue the scientific research needed to support the development of advanced human exploration capabilities. Although its review has left it deeply concerned about the current state of NASA's life and physical sciences research the Committee for the Decadal Survey on Biological and Physical Sciences in Space is nevertheless convinced that a focused science and engineering program can achieve successes that will bring the space community the U.S. public and policymakers to an understanding that we are ready for the next significant phase of human space exploration. The goal of this report is to lay out steps and develop a forward looking portfolio of research that will provide the basis for recapturing the excitement and value of human spaceflight thereby enabling the U.S. space program to deliver on new exploration initiatives that serve the nation, excite the public and place the United States again at the forefront of space exploration for the global good.

**Microgravity Combustion** Howard D. Ross, 2001. This book provides an introduction to understanding combustion the burning of a substance that produces heat and often light in microgravity environments i.e. environments with very low gravity such as outer space. Readers are presented with a compilation of worldwide findings from fifteen years of research and experimental tests in various low gravity environments including drop towers, aircraft and space. Microgravity Combustion is unique in that no other book reviews low gravity combustion research in such a comprehensive manner. It provides an excellent introduction for those researching in the fields of combustion, aerospace and fluid and thermal sciences. An introduction to the progress made in understanding combustion in a microgravity environment. Experimental, theoretical and computational findings of current combustion research. Tutorial concepts such as scaling analysis. Worldwide microgravity research findings. *NASA Space Technology Roadmaps and Priorities Revisited* National Academies of Sciences, Engineering, and Medicine, Division on Engineering and Physical Sciences, Aeronautics and Space Engineering Board, Committee on NASA Technology Roadmaps, 2016-11-10. Historically the United States has been a world leader in aerospace endeavors in both the government and commercial sectors. A key factor in aerospace leadership is continuous development of advanced technology which is critical to U.S. ambitions in space including a human mission to Mars. To continue to achieve progress NASA is currently executing a series of aeronautics and space technology programs using a roadmapping process to identify technology needs and improve the management of its technology development portfolio. NASA created a set of 14 draft technology roadmaps in 2010 to guide the development of space technologies. In 2015 NASA issued a revised set of roadmaps. A significant new aspect of the update has been the effort to assess the relevance of the technologies by listing the enabling and enhancing technologies for specific design reference missions (DRMs) from the

Human Exploration and Operations Mission Directorate and the Science Mission Directorate NASA Space Technology Roadmaps and Priorities Revisited prioritizes new technologies in the 2015 roadmaps and recommends a methodology for conducting independent reviews of future updates to NASA's space technology roadmaps which are expected to occur every 4 years

Piantadosi, 2013-01-01 Seeking to reenergize Americans passion for the space program the value of further exploration of the Moon and the importance of human beings on the final frontier Claude A Piantadosi presents a rich history of American space exploration and its major achievements He emphasizes the importance of reclaiming national command of our manned program and continuing our unmanned space missions and he stresses the many adventures that still await us in the unfolding universe Acknowledging space exploration's practical and financial obstacles Piantadosi challenges us to revitalize American leadership in space exploration in order to reap its scientific bounty Piantadosi explains why space exploration a captivating story of ambition invention and discovery is also increasingly difficult and why space experts always seem to disagree He argues that the future of the space program requires merging the practicalities of exploration with the constraints of human biology Space science deals with the unknown and the margin and budget for error is small Lethal near vacuum conditions deadly cosmic radiation microgravity vast distances and highly scattered resources remain immense physical problems To forge ahead America needs to develop affordable space transportation and flexible exploration strategies based in sound science Piantadosi closes with suggestions for accomplishing these goals combining his healthy skepticism as a scientist with an unshakable belief in space's untapped and wholly worthwhile potential
