**Parallel and Distributed Processing and Applications** Jiannong Cao, Laurence T. Yang, Minyi Guo, Francis Lau, 2005-01-17

Welcome to the proceedings of the 2nd International Symposium on Parallel and Distributed Processing and Applications ISPA 2004 which was held in Hong Kong China 13-15 December 2004 With the advance of computer networks and hardware technology parallel and distributed processing has become a key technology which plays an important part in determining future research

and development activities in many academic and industrial branches. It provides a means to solve computationally intensive problems by improving processing speed. It is also the only able approach to building highly reliable and inherently distributed applications.

ISPA2004 provided a forum for scientists and engineers in academia and industry to exchange and discuss their experiences, new ideas, research results, and applications about all aspects of parallel and distributed computing. There was a very large number of paper submissions: 361 from 26 countries and regions including not only Asia and the Pacific but also Europe and North America. All submissions were reviewed by at least three program or technical committee members or external reviewers. It was extremely difficult to select the presentations for the conference because there were so many excellent and interesting submissions. In order to allocate as many papers as possible and keep the high quality of the conference, we finally decided to accept 78 regular papers and 38 short papers for oral technical presentations. We believe that all of these papers and topics not only provide novel ideas, new results, work in progress, and state-of-the-art techniques in this field but also stimulate future research activities in the area of parallel and distributed computing with applications.

Advances in Edge Computing: Massive Parallel Processing and Applications F. Khafa, A.K. Sangaiah, 2020-03-10. The rapid advance of Internet of Things (IoT) technologies has resulted in the number of IoT connected devices growing exponentially with billions of connected devices worldwide. While this development brings with it great opportunities for many fields of science, engineering, business, and everyday life, it also presents challenges such as an architectural bottleneck with a very large number of IoT devices connected to a rather small number of servers in Cloud data centers and the problem of data deluge. Edge computing aims to alleviate the computational burden of the IoT for the Cloud by pushing some of the computations and logics of processing from the Cloud to the Edge of the Internet. It is becoming commonplace to allocate tasks and applications such as data filtering, classification, semantic enrichment, and data aggregation to this layer but to prevent this new layer from itself becoming another bottleneck for the whole computing stack from IoT to the Cloud, the Edge computing layer needs to be capable of implementing massively parallel and distributed algorithms efficiently. This book *Advances in Edge Computing: Massive Parallel Processing and Applications* addresses these challenges in 11 chapters. Subjects covered include Fog storage, software architecture, IoT-based crowdsourcing, the industrial Internet of Things, privacy issues, smart home management in the Cloud, and the Fog and a cloud robotic solution to assist medical applications. Providing an overview of developments in the field, the book will be of interest to all those working with the Internet of Things and Edge computing.

**Patterns and Skeletons for Parallel and Distributed Computing** Fethi A. Rabhi, Sergei Gorlatch, 2011-06-28. *Patterns and Skeletons for Parallel and Distributed Computing* is a unique survey of research work in high-level parallel and distributed computing over the past ten years. Comprising contributions from the leading researchers in Europe and the US, it looks at interaction patterns and their role in parallel and distributed processing and demonstrates for the first time the link between skeletons and design patterns. It

focuses on computation and communication structures that are beyond simple message passing or remote procedure calling and also on pragmatic approaches that lead to practical design and programming methodologies with their associated compilers and tools The book is divided into two parts which cover skeletons related material such as expressing and composing skeletons formal transformation cost modelling and languages compilers and run time systems for skeleton based programming design patterns and other related concepts applied to other areas such as real time embedded and distributed systems It will be an essential reference for researchers undertaking new projects in this area and will also provide useful background reading for advanced undergraduate and postgraduate courses on parallel or distributed system design

Parallel and Distributed Computation R. Correa, Ines de Castro Dutra, Mario Fiallos, Luiz Fernando Gomes da Silva, 2013-06-29

Parallel and distributed computation has been gaining a great lot of attention in the last decades. During this period, the advances attained in computing and communication technologies and the reduction in the costs of those technologies played a central role in the rapid growth of the interest in the use of parallel and distributed computation in a number of areas of engineering and sciences. Many actual applications have been successfully implemented in various platforms varying from pure shared memory to totally distributed models passing through hybrid approaches such as distributed shared memory architectures. Parallel and distributed computation differs from classical sequential computation in some of the following major aspects: the number of processing units, independent local clock for each unit, the number of memory units, and the programming model. For representing this diversity and depending on what level we are looking at the problem, researchers have proposed some models to abstract the main characteristics or parameters: physical components or logical mechanisms of parallel computers. The problem of establishing a suitable model is to find a reasonable trade-off among simplicity, power of expression, and universality. Then be able to study and analyze more precisely the behavior of parallel applications.

Distributed and Parallel Systems Peter Kacsuk, Robert Lovas, Zolt Nemeth, 2008-08-07. DAPSYS International Conference on Distributed and Parallel Systems is an international biannual conference series dedicated to all aspects of distributed and parallel computing. DAPSYS 2008, the 7th International Conference on Distributed and Parallel Systems, was held in September 2008 in Hungary. Distributed and Parallel Systems: Desktop Grid Computing based on DAPSYS 2008 presents original research, novel concepts and methods, and outstanding results. Contributors investigate parallel and distributed techniques, algorithms, models, and applications; present innovative software tools, environments, and middleware; focus on various aspects of grid computing; and introduce novel methods for development, deployment, testing, and evaluation. This volume features a special focus on desktop grid computing as well. Designed for a professional audience composed of practitioners and researchers in industry, this book is also suitable for advanced level students in computer science.
