Pardalos,2013-12-01 Techniques and principles of minimax theory play a key role in many areas of research including game theory optimization and computational complexity In general a minimax problem can be formulated as $\min \max_{y \in Y} f(x, y)$ where $f(x, y)$ is a function defined on the product of X and Y spaces There are two basic issues regarding minimax problems The first issue concerns the establishment of sufficient and necessary conditions for equality $\min \max_{y \in Y} f(x, y) = \max_{x \in X} \min_{y \in Y} f(x, y)$ The classical minimax theorem of von Neumann is a result of this type Duality theory in linear and convex quadratic programming interprets minimax theory in a different way The second issue concerns the establishment of sufficient and necessary conditions for values of the variables x and y that achieve the global minimax function value $\min \max_{y \in Y} f(x, y)$ There are two developments in minimax theory that we would like to mention

Parallel Processing and Parallel Algorithms Seyed H Roosta,2012-12-06 Motivation It is now possible to build powerful single processor and multiprocessor systems and use them efficiently for data

processing which has seen an explosive expansion in many areas of computer science and engineering. One approach to meeting the performance requirements of the applications has been to utilize the most powerful single processor system that is available. When such a system does not provide the performance requirements, pipelined and parallel processing structures can be employed. The concept of parallel processing is a departure from sequential processing. In sequential computation, one processor is involved and performs one operation at a time. On the other hand, in parallel computation, several processors cooperate to solve a problem which reduces computing time because several operations can be carried out simultaneously. Using several processors that work together on a given computation illustrates a new paradigm in computer problem solving which is completely different from sequential processing. From the practical point of view, this provides sufficient justification to investigate the concept of parallel processing and related issues such as parallel algorithms. Parallel processing involves utilizing several factors such as parallel architectures, parallel algorithms, parallel programming languages, and performance analysis, which are strongly interrelated. In general, four steps are involved in performing a computational problem in parallel. The first step is to understand the nature of computations in the specific application domain.
