### **Concurrency Control in Distributed System Using Mutual Exclusion**

Sukhendu Kanrar,Nabendu Chaki,Samiran Chattopadhyay,2017-08-04 The book presents various state of the art approaches for process synchronization in a distributed environment The range of algorithms discussed in the book starts from token based mutual exclusion algorithms that work on tree based topology Then there are interesting solutions for more flexible logical topology like a directed graph with or without cycle In a completely different approach one of the chapters presents two recent voting based DME algorithms All DME algorithms presented in the book aim to ensure fairness in terms of first come first serve FCFS order among equal priority processes At the same time the solutions consider the priority of the requesting processes and allocate resource for the earliest request when no such request from a higher priority process is pending

Transactions on Large-Scale Data- and Knowledge-Centered Systems I Abdelkader Hameurlain,Josef Küng,Roland Wagner,2009-08-28 Data management knowledge discovery and knowledge processing are core and hot topics in computer science They are widely accepted as enabling technologies for modern enterprises enhancing their performance and their decision making processes Since the 1990s the Internet has been the outstanding driving force for application development in all domains An increase in the demand for resource sharing e g computing resources s vices metadata data sources across different sites connected through networks has led to an evolvement of data and knowledge management systems from centralized systems to decentralized systems enabling large scale distributed applications prov ing high scalability Current decentralized systems still focus on data and knowledge as their main resource characterized by heterogeneity of nodes data and knowledge autonomy of data and knowledge sources and services large scale data volumes high numbers of data sources users computing resources dynamicity of nodes These characteristics recognize i limitations of methods and techniques developed for centralized systems ii requirements to extend or design new approaches and methods enhancing efficiency

dynamicity and scalability iii development of large scale experimental platforms and relevant benchmarks to evaluate and validate scaling Feasibility of these systems relies basically on P2P peer to peer techniques and agent systems supporting with scaling and decentralized control Synergy between Grids P2P systems and agent technologies is the key to data and knowledge centered systems in large scale environments      *Mobile Agents in Networking and Distributed Computing* Jiannong Cao,Sajal Kumar Das,2012-07-31 The book focuses on mobile agents which are computer programs that can autonomously migrate between network sites This text introduces the concepts and principles of mobile agents provides an overview of mobile agent technology and focuses on applications in networking and distributed computing      **Embedded Systems and Wireless Technology** Raul A. Santos,Arthur Edwards Block,2012-06-22 The potential of embedded systems ranges from the simplicity of sharing digital media to the coordination of a variety of complex joint actions carried out between collections of networked devices The book explores the emerging use of embedded systems and wireless technologies from theoretical and practical applications and their applications in a      **Power Efficiency in Broadband Wireless Communications** Pooria Varahram,Somayeh Mohammady,Borhanuddin Mohd Ali,Nasri Sulaiman,2014-08-29 Power Efficiency in Broadband Wireless Communications focuses on the improvement of power efficiency in wireless communication systems especially of mobile devices Reviewing cutting edge techniques for conserving power and boosting power efficiency the book examines various technologies and their impact on consumer devices It considers each tec

**Structured Peer-to-Peer Systems** Dmitry Korzun,Andrei Gurtov,2012-11-12 The field of structured P2P systems has seen fast growth upon the introduction of Distributed Hash Tables DHTs in the early 2000s The first proposals including Chord Pastry Tapestry were gradually improved to cope with scalability locality and security issues By utilizing the processing and bandwidth resources of end users the P2P approach enables high performance of data distribution which is hard to achieve with traditional client server architectures The P2P computing community is also being actively utilized for software updates to the Internet P2PSIP VoIP video on demand and distributed backups The recent introduction of the identifier locator split proposal for future Internet architectures poses another important application for DHTs namely mapping between host permanent identity and changing IP address The growing complexity and scale of modern P2P systems requires the introduction of hierarchy and intelligence in routing of requests Structured Peer to Peer Systems covers fundamental issues in organization optimization and tradeoffs of present large scale structured P2P systems as well as provides principles analytical models and simulation methods applicable in designing future systems Part I presents the state of the art of structured P2P systems popular DHT topologies and protocols and the design challenges for efficient P2P network topology organization routing scalability and security Part II shows that local strategies with limited knowledge per peer provide the highest scalability level subject to reasonable performance and security constraints Although the strategies are local their efficiency is due to elements of hierarchical organization which appear in many DHT designs that traditionally

are considered as flat ones Part III describes methods to gradually enhance the local view limit when a peer is capable to operate with larger knowledge still partial about the entire system These methods were formed in the evolution of hierarchical organization from flat DHT networks to hierarchical DHT architectures look ahead routing and topology aware ranking Part IV highlights some known P2P based experimental systems and commercial applications in the modern Internet The discussion clarifies the importance of P2P technology for building present and future Internet systems

**Architecture-Aware Online Failure Prediction for Software Systems** Teerat Pitakrat, 2018-06-19 Failures at runtime in complex software systems are inevitable because these systems usually contain a large number of components Having all components working perfectly at the same time is if at all possible very difficult Hardware components can fail and software components can still have hidden faults waiting to be triggered at runtime and cause the system to fail This dissertation proposes an architecture aware online failure prediction approach called Hora The Hora approach improves online failure prediction by combining the results of failure prediction with the architectural knowledge about the system The task of failure prediction is split into predicting the failure of each individual component in contrast to predicting the whole system failure Suitable prediction techniques can be employed for different types of components The architectural knowledge is used to deduce the dependencies between components which can reflect how a failure of one component can affect the others The failure prediction and the component dependencies are combined into one model which employs Bayesian

network theory to represent failure propagation The combined model is continuously updated at runtime and makes predictions for individual components as well as inferring their effects on other components and the whole system
