## **Parallel Time:**

**Parallel Time** Brent Staples, 2017-09-27 From Pulitzer Prize winner Brent Staples an evocative memoir that poses universal questions Where does the family end and the self begin What do we owe our families and what do we owe our dreams for ourselves What part of the past is a gift and what part a shackle For Brent Staples there is the added dimension of race moving from a black world into one largely defined by whites The oldest son among nine children Brent grew up in a small industrial town near Philadelphia First a scholarship to a local college and then one for graduate study at the University of Chicago pulled him out of the close family circle While he was away the industries that supported the town failed and drug dealing rushed in to fill the economic void News of arrests and premature deaths among Brent's childhood friends underscored the precariousness of his perch in a world of mostly white achievers A younger brother became a cocaine dealer and was murdered by one of his clients His death propelled Brent into a reconsideration of his childhood and coming of age that offers vivid portraits of family and place of values that supported and pressures that tore apart of the appeal and pain of entering a predominantly white world and of the strengths and vulnerabilities of the black world he grew away from

**Cryptography in Constant Parallel Time** Benny Applebaum, 2013-12-19 Locally computable NC0 functions are simple functions for which every bit of the output can be computed by reading a small number of bits of their input The study of locally computable cryptography attempts to construct cryptographic functions that achieve this strong notion of simplicity and simultaneously provide a high level of security Such constructions are highly parallelizable and they can be realized by Boolean circuits of constant depth This book establishes for the first time the possibility of local implementations for many basic cryptographic primitives such as one way functions pseudorandom generators encryption schemes and digital signatures It also extends these results to other stronger notions of locality and addresses a wide variety of fundamental questions about local cryptography The author's related thesis was honorably mentioned runner up for the ACM Dissertation Award in 2007 and this book includes some expanded sections and proofs and notes on recent developments The book assumes only a minimal background in computational complexity and cryptography and is therefore suitable for graduate students or researchers in related areas who are interested in parallel cryptography It also introduces general techniques and tools which are likely to interest experts in the area

a seamless integration of the romance of art and the drama of science and an exhilarating history of ideas      **Lectures in Parallel Computation** Alan Gibbons, Paul Spirakis, 1993-03-18 The foundations of parallel computation especially the efficiency of computation are the concern of this book Distinguished international researchers have contributed fifteen chapters which together form a coherent stream taking the reader who has little prior knowledge of the field to a position of being familiar with leading edge issues The book may also function as a source of teaching material and reference for researchers The first part is devoted to the Parallel Random Access Machine P RAM model of parallel computation The initial chapters justify and define the model which is then used for the development of algorithm design in a variety of application areas such as deterministic algorithms randomisation and algorithm resilience The second part deals with distributed memory models of computation The question of efficiently implementing P RAM algorithms within these models is addressed as are the immensely interesting prospects for general purpose parallel computation      Design and Analysis of Algorithms Sandeep Sen, Amit Kumar, 2019-05-23 The text covers important algorithm design techniques such as greedy algorithms dynamic programming and divide and conquer and gives applications to contemporary problems Techniques including Fast Fourier transform KMP algorithm for string matching CYK algorithm for context free parsing and gradient descent for convex function minimization are discussed in detail The book s emphasis is on computational models and their effect on algorithm design It gives insights into algorithm design techniques in parallel streaming and memory hierarchy computational models The book also emphasizes the role of randomization in algorithm design and gives numerous applications ranging from data structures such as skip lists to dimensionality reduction methods      **Solving Partial Differential Equations on Parallel Computers** Jianping Zhu, 1994 This is an introductory book on supercomputer applications written by a researcher who is working on solving scientific and engineering application problems on parallel computers The book is intended to quickly bring researchers and graduate students working on numerical solutions of partial differential equations with various applications into the area of parallel processing The book starts from the basic concepts of parallel processing like speedup efficiency and different parallel architectures then introduces the most frequently used algorithms for solving PDEs on parallel computers with practical examples Finally it discusses more advanced topics including different scalability metrics parallel time stepping algorithms and new architectures and heterogeneous computing networks which have emerged in the last few years of high performance computing Hundreds of references are also included in the book to direct interested readers to more detailed and in depth discussions of specific topics      **Interconnection Networks and Mapping and Scheduling Parallel Computations** Derbiau Frank Hsu, Arnold L. Rosenberg, Dominique Sotteau, 1995 The interconnection network is one of the most basic components of a massively parallel computer system Such systems consist of hundreds or thousands of processors interconnected to work cooperatively on computations One of the central problems in parallel computing is the task of mapping a collection of processes onto the processors and routing network of a parallel machine

Once this mapping is done it is critical to schedule computations within and communication among processors so that the necessary inputs for a process are available where and when the process is scheduled to be computed This book contains the refereed proceedings of a DIMACS Workshop on Massively Parallel Computation held in February 1994 The workshop brought together researchers from universities and laboratories as well as practitioners involved in the design implementation and application of massively parallel systems Focusing on interconnection networks of parallel architectures of today and of the near future the book includes topics such as network topologies network properties message routing network embeddings network emulation mappings and efficient scheduling
