

satisfaction from economic activity to be equal except in the case of the saving decision.

Pigou had assumed measurability and interpersonal comparison of utility, and had drawn some conclusions from the premise that aggregate social utility ought to be maximised. He explained this through the concept of *'ideal output or ideal allocation'*.

For Pigou, a situation *'in which each several sort of resource is allocated in such a way that the last unit of it in any one use yields a physical product of the same money value as the last unit of it in any other use'* is one of ideal allocation, irrespective of the distribution of money incomes. If it is a community comprising rich and poor people, then *'though it is true that aggregate satisfaction can be increased by departures from this type of allocation in ways deliberately designed to benefit poor people, it is probable that departures taken at random, e.g., through the operation of monopoly power, would diminish aggregate satisfaction'*. Therefore, according to Pigou, *'such an allocation is properly called the ideal allocation with respect to the existing distribution of money income'*.

14.2.1 Pigovian Analysis

The starting point of the Pigovian welfare analysis is the notion that there is a resource allocation problem that can be optimally solved. Through his work, Pigou made clear that society was faced with the choice of *how to allocate scarce productive resources to competing ends* and was to maximise total social welfare. In practical terms, this reduced to maximising economic welfare, *'that part of total welfare which can be brought directly or indirectly into relation with a money measure'*.

Pigou was concerned about the channeling of "real" factors of production to their best uses. He saw particular configurations of factors of production as yielding a measurable worth of total output and sought that arrangement generating a maximum value.

After setting the main problem of inquiry as *'the allocation of real factors of production to maximise the total value of output'*, Pigou tried to describe some characteristics indicative of an optimal configuration and define deviations from this optimal solution as inefficient. A crucial part of the analysis was the concept of *changes in output resulting from a movement of resources from one use to another*. Pigou defined *marginal net product* as *'the difference between the aggregate flow of product for which flow of resources, when appropriately organised, is responsible and the aggregate flow of product for which a flow of resources differing from that flow by a small (marginal) increment, when appropriately organised, would be responsible'*.

Pigou then drew a distinction between *social* and *private marginal net product*. The *marginal social net product* is the *'total net product of physical things or objective services due to the marginal increment of resources in any given use or place, no matter to whom any part of this product may accrue'*. It might happen, for example, that costs are thrown upon people not directly concerned, through, say, uncompensated damage done to surrounding woods by sparks from railway engines. All such effects must be included—some of them positive, others negative elements in reckoning up the social net product of the marginal increment of any volume of resources turned into any use or place. The *marginal private net product* is that *'part of the total net product of*
