L'vovich Sobolev, 1964 *Mathematical Physics with Partial Differential Equations* James Kirkwood, 2011-12-01

*Mathematical Physics with Partial Differential Equations* is for advanced undergraduate and beginning graduate students taking a course on mathematical physics taught out of math departments The text presents some of the most important topics and methods of mathematical physics The premise is to study in detail the three most important partial differential equations in the field the heat equation the wave equation and Laplace's equation The most common techniques of solving such equations are developed in this book including Green's functions the Fourier transform and the Laplace transform which all have applications in mathematics and physics far beyond solving the above equations The book's focus is on both the equations and their methods of solution Ordinary differential equations and PDEs are solved including Bessel Functions making the book useful as a graduate level textbook The book's rigor supports the vital sophistication for someone wanting to continue further in areas of mathematical physics Examines in depth both the equations and their methods of solution Presents physical concepts in a mathematical framework Contains detailed mathematical derivations and solutions reinforcing the material through repetition of both the equations and the techniques Includes several examples solved by multiple methods highlighting the strengths and weaknesses of various techniques and providing additional practice

**Partial Differential Equations in Classical Mathematical Physics** Isaak Rubinstein, Lev Rubinstein, 1998-04-28 The unique feature of this book is that it considers the theory of partial differential equations in mathematical physics as the language of continuous processes that is as an interdisciplinary science that treats the hierarchy of mathematical phenomena as reflections of their physical counterparts Special attention is drawn to tracing the development of these mathematical phenomena in different natural sciences with examples drawn from continuum mechanics electrodynamics transport phenomena thermodynamics and chemical kinetics At the same time the authors trace the interrelation between the different types of problems elliptic parabolic and hyperbolic as the mathematical counterparts of stationary and evolutionary processes This combination of mathematical comprehensiveness and natural scientific motivation represents a step forward in the presentation of the classical theory of PDEs one that will be appreciated by both students and researchers alike

Partial Differential Equations of Mathematical Physics Arthur Godon Webster, 2016-06-20 A classic treatise on partial differential equations this comprehensive work by one of America's greatest early mathematical physicists covers the basic method theory and application of partial differential equations In addition to its value as an introductory and supplementary

text for students this volume constitutes a fine reference for mathematicians physicists and research engineers Detailed coverage includes Fourier series integral and elliptic equations spherical cylindrical and ellipsoidal harmonics Cauchy's method boundary problems the Riemann Volterra method and many other basic topics The self contained treatment fully develops the theory and application of partial differential equations to virtually every relevant field vibration elasticity potential theory the theory of sound wave propagation heat conduction and many more A helpful Appendix provides background on Jacobians double limits uniform convergence definite integrals complex variables and linear differential equations

Partial Differential Equations of Mathematical Physics S. L. Sobolev, 2016-06-06 Pure and Applied Mathematics Volume 56 Partial Differential Equations of Mathematical Physics provides a collection of lectures related to the partial differentiation of mathematical physics This book covers a variety of topics including waves heat conduction hydrodynamics and other physical problems Comprised of 30 lectures this book begins with an overview of the theory of the equations of mathematical physics that has its object the study of the integral differential and functional equations describing various natural phenomena This text then examines the linear equations of the second order with real coefficients Other lectures consider the Lebesgue Fubini theorem on the possibility of changing the order of integration in a multiple integral This book discusses as well the Dirichlet problem and the Neumann problem for domains other than a sphere or half space The final lecture deals with the properties of spherical functions This book is a valuable resource for mathematicians
