## **Parasitic Helminths And Zoonoses In Africa:**

Parasitic helminths and zoonoses in Africa P. Craig, C. MacPherson, 2012-12-06 Helminths include one of the most diverse and geographically widespread groups of parasites which infect humans and animals About 100 species have been reported from humans usually producing asymptomatic infection or mild symptoms However about 20 species are of public health importance causing severe or even fatal infections In many parts of Africa parasitic helminths are responsible for enormous economic losses hampering rural development programmes and reducing the pace of economic growth Many parasitic helminths are either zoonoses diseases naturally transmitted between vertebrate animals and man or have evolved from animal parasites The modification of the environment through wars famine and the ever expanding and increasingly mobile human population brings people into close contact with new environments and wildlife species which makes the study and control of zoonoses of special interest and complexity In Africa the transmission of helminth parasites is highly influenced by the ever changing social and cultural differences between diverse groups of peoples and their interaction with wild and domestic animals It is not surprising therefore that approaches to the study and control of parasitic zoonoses require intersectoral cooperation between physicians veterinarians parasitologists zoologists demographers anthropologists engineers and economists to provide the breadth of knowledge and expertise required to develop our understanding of these diseases and to devise methods for their control This book provides a selective compilation of parasitic helminths many of which are zoonoses which create important economic and public health problems in Africa *Helminth Zoonoses* S. Geerts, V. Kumar, J. Brandt, 2012-12-06 In spite of the availability of modern broad spectrum anthelmintic drugs the prevention and control of helminth zoonoses remain a challenge to human and veterinary parasitologists and to physicians and veterinarians working on the field Although the life cycles of most helminths of zoonotic importance are well known there are still major gaps in our knowledge especially in the fields of epidemiology diagnosis and treatment The International Colloquium on Helminth Zoonoses held at the Institute of Tropical Medicine Antwerp 11-12 December 1986 laid emphasis on more recent advances made in the control and epidemiology of these zoonotic diseases The disease complexes echinococcosis hydatidosis taeniasis cysticercosis and the larva migrans syndrome were dealt with in considerable detail In the first chapter the phenomenon of strain variation in *Echinococcus* spp is examined in the light of newer findings The progress made in recent years towards a more specific diagnosis and drug targeting in hydatidosis is reported In the second chapter recent advances in immunisation and treatment of cysticercosis are dealt with The possibility of the existence of strain differences in *Taenia saginata* is also discussed The third chapter is devoted to trematode zoonoses with particular reference to the situation in South east Asia Senegal schistosomiasis and Liberia paragonimiasis In the last chapter the larva migrans syndrome is treated in detail with special attention to its etiology and diagnosis Reports on lesser known nematode zoonoses like mammomonosomiasis and oesophagostomiasis are included *Parasitic Helminths and Zoonoses*
