Magnesium in the Central Nervous System Robert Vink,Mihai Nechifor,2011 The brain is the most complex organ in our body Indeed it is perhaps the most complex structure we have ever encountered in nature Both structurally and functionally there are many peculiarities that differentiate the brain from all other organs The brain is our connection to the world around us and by governing nervous system and higher function any disturbance induces severe neurological and psychiatric disorders that can have a devastating effect on quality of life Our understanding of the physiology and biochemistry of the brain has improved dramatically in the last two decades In particular the critical role of cations including magnesium has become evident even if incompletely understood at a mechanistic level The exact role and regulation of magnesium in particular remains elusive largely because intracellular levels are so difficult to routinely quantify Nonetheless the importance of magnesium to normal central nervous system activity is self evident given the complicated homeostatic mechanisms that maintain the concentration of this cation within strict limits essential for normal physiology and metabolism There is also considerable accumulating evidence to suggest alterations to some brain functions in both normal and pathological conditions may be linked to alterations in local magnesium concentration This book containing chapters written by some of the foremost experts in the field of magnesium research brings together the latest in experimental and clinical magnesium research as it relates to the central nervous system It offers a complete and updated view of magnesiums involvement in central nervous system function and in so doing brings together two main pillars of contemporary neuroscience research namely providing an explanation for the molecular mechanisms involved in brain function and emphasizing the connections between the molecular changes and behavior It is the untiring efforts of those magnesium researchers who have dedicated their lives to unraveling the mysteries of magnesiums role in biological systems that has inspired the collation of this volume of work

Locomotion and Posture in Older Adults Fabio Augusto Barbieri,Rodrigo Vitória,2017-02-07 This book is an

attempt to advance the discussion and improve our understanding about the effects of aging and movement disorders on motor control during walking and postural tasks. Despite these activities are performed daily, there is a high requirement of motor and neural systems in order to perform both tasks efficiently. Both walking and posture require a complex interaction of musculoskeletal and neural systems. However, the mechanisms used to control these tasks as well as how they are planned and coordinated are still a question of discussion among health professionals and researchers. In addition, this discussion is more interesting when the effects of aging are included in the context of locomotion and the postural control. The number of older individuals is 841 million in 2015, which is four times higher than the 202 million that lived in 1950. Aging causes many motor, sensorial, and neural deficits which impair locomotion and postural control in the elderly. The severity of this framework is worsened when the aging goes along with a movement disorder such as Parkinson disease, Chorea, Dystonia, Huntington disease, etc. Therefore, the aim of this book is to highlight the influence of different aspects on planning, controlling, and performing locomotion and posture tasks. In attempting to improve current knowledge in this field, invited authors present and discuss how environmental, sensorial, motor, cognitive, and individual aspects influence the planning and performance of locomotor and postural activities. The major thrust of the book is to address the mechanisms involved in controlling and planning motor action in neurologically healthy individuals as well as in those who suffer from movement disorders or face the effects of aging, indicating the aspects that impair locomotion and postural control. In addition, new technologies, tools, and interventions designed to manage the effects of aging and movement disorders are presented in the book.

Ending Parkinson's Disease Ray Dorsey, Michael S. Okun, Todd Sherer, Bastiaan R. Bloem, 2021-03-16. In this must-read guide, Lonnie Ali, four leading doctors, and advocates offer a bold action plan to prevent, care for, and treat Parkinson's disease, one of the great health challenges of our time. Brain diseases are now the world's leading source of disability. The fastest growing of these is Parkinson's; the number of impacted patients has doubled to more than six million over the last twenty-five years and is projected to double again by 2040. Harmful pesticides that increase the risk of Parkinson's continue to proliferate; many people remain undiagnosed and untreated; research funding stagnates; and the most effective treatment is now a half-century old. In *Ending Parkinson's Disease*, four top experts provide a plan to help prevent Parkinson's, improve care and treatment, and end the silence associated with this devastating disease.
