Recurrent Urinary Tract Infection: Update for the 70s George Elmer Schreiner, Thomas Alexander Stamey, 1973

Bacterial Biofilms Tony Romeo, 2008-02-26 Throughout the biological world bacteria thrive predominantly in surface attached matrix enclosed multicellular communities or biofilms as opposed to isolated planktonic cells This choice of lifestyle is not trivial as it involves major shifts in the use of genetic information and cellular energy and has profound consequences for bacterial physiology and survival Growth within a biofilm can thwart immune function and antibiotic therapy and thereby complicate the treatment of infectious diseases especially chronic and foreign device associated infections Modern studies of many important biofilms have advanced well beyond the descriptive stage and have begun to provide molecular details of the structural biochemical and genetic processes that drive biofilm formation and its dispersion There is much diversity in the

details of biofilm development among various species but there are also commonalities In most species environmental and nutritional conditions greatly influence biofilm development Similar kinds of adhesive molecules often promote biofilm formation in diverse species Signaling and regulatory processes that drive biofilm development are often conserved especially among related bacteria Knowledge of such processes holds great promise for efforts to control biofilm growth and combat biofilm associated infections This volume focuses on the biology of biofilms that affect human disease although it is by no means comprehensive It opens with chapters that provide the reader with current perspectives on biofilm development physiology environmental and regulatory effects the role of quorum sensing and resistance phenotypic persistence to antimicrobial agents during biofilm growth
