An Improved Lightweight Privacy Preserving Authentication Scheme for SIP-Based-VoIP Using Smart Card Saeed Ullah Jan, 2017-03-09 In the past few years secure information sharing became very popular in the area of immigration military applications healthcare education foreign affairs etc As secure communication utilizes both wireless and wired communication mechanizations for exchanging sensitive information security and privacy of the information exchange cannot be easily compromised To moderate the security integrity authenticity and privacy issues related to information exchange numerous authentication mechanisms have been recommended by different researchers in the literature in recent times but these are vulnerable to prospective security flaws such as masquerade insider replay impersonation password guessing server spoofing denial of service attacks and in addition have failed to deliver mutual authentication In the past few years we have also witnessed a balanced growth in the acceptance of VoIP Voice over IP facilities because the numerous Web and VoIP applications depend on huge and extremely distributed infrastructures to process requests from millions of users in an appropriate manner Due to their extraordinary desires these large scale internet applications have frequently surrendered security for other objectives such as performance scalability and availability As a result these applications have characteristically favored weaker but well organized security mechanisms in their foundations Session Initiation Protocol SIP is an application and presentation layers signaling protocol that initiates modifies and terminates IP based multimedia sessions Implementing SIP for secure communication has been a topic of study for the past decade and several proposals are available in the research domain However security aspects are not addressed in most of these proposals because SIP is exposed to several threats and faces security issues at these layers Probes for SIP Session Initiation Protocol servers have been conveyed for many years To gather more details about these activities the author has designed a scheme for SIP servers in a network and composed data about some popular attacks

Furthermore he explains his interpretations and guidance on how to prevent these attacks from being successful Biometrics a new field of research has also been dealt with in this research by means of a three factor authentication scheme in which one factor is biometrics

Encyclopedia of Cryptography, Security and Privacy Sushil Jajodia, Pierangela Samarati, Moti Yung, 2025-01-10. A rich stream of papers and many good books have been written on cryptography, security and privacy but most of them assume a scholarly reader who has the time to start at the beginning and work his way through the entire text. The goal of Encyclopedia of Cryptography, Security and Privacy Third Edition is to make important notions of cryptography, security and privacy accessible to readers who have an interest in a particular concept related to these areas but who lack the time to study one of the many books in these areas. The third edition is intended as a replacement of Encyclopedia of Cryptography and Security Second Edition that was edited by Henk van Tilborg and Sushil Jajodia and published by Springer in 2011. The goal of the third edition is to enhance on the earlier edition in several important and interesting ways. First, entries in the second edition have been updated when needed to keep pace with the advancement of state of the art. Second, as noticeable already from the title of the encyclopedia, coverage has been expanded with special emphasis to the area of privacy. Third, considering the fast pace at which information and communication technology is evolving and has evolved drastically since the last edition, entries have been expanded to provide comprehensive view and include coverage of several newer topics.
