Past And Present Vegetation Of The Far Northwest Canada:

Past and Present Vegetation of the Far Northwest of Canada James Cunningham Ritchie, 1984 Quaternary history of vegetation in the northern Yukon and adjacent Mackenzie Delta region **Post-glacial Vegetation of Canada** J. C. Ritchie, 2004-04 This book brings together all the available information about the complex history of vegetational and environmental change in Canada since the last Ice Age Professor Ritchie discusses the roles of climatic change wildfires diseases and biological factors in controlling the emerging patterns of new plant growth Vegetation history B. Huntley, T. Webb III, 2012-12-06 The analysis of vegetation history is one of the prime objectives for vegetation scientists In order to understand the recent composition of local floras and plant communities a second knowledge of species composition during recent millennia is essential With the present concern over climate changes due to human activities an understanding of past vegetation distribution becomes even more important since the correlation between climate and vegetation can often be used to predict possible impacts to crops and forests I was very fortunate to receive the help of Drs Webb and Huntley to compile this volume on vegetation history They have collated an impressive set of papers which together give an account of the vegetation history of most of the continents during the late Tertiary and Quaternary periods There are however gaps in the coverage achieved most notably Africa and Asia apart from Japan The information in this book will nonetheless certainly be used widely by vegetation scientists for the regions covered in the book and much of it has relevance to the areas not explicitly described The authors of the individual chapters have done their best to cover recent topics of interest as well as established facts It is intended that a separate volume will be produced in the near future covering the vegetation history of Africa and Asia I thank the editors of It fits well into this volume for their commendable achievement Canada's Cold Environments Hugh M. French, Olav Slaymaker, 1993 Low temperatures wind chill snow sea ice and permafrost have been primary characteristics of Canada's northern and alpine environments during the past two million years The evolution of Canada's cultural landscapes the processes of settlement of rural areas and the present interaction of Canadian industrial society with its biophysical environment are all deeply influenced directly or indirectly by the frigidity of the greater part of the country The phenomenon of global warming if it occurs will lessen this coldness but its impact on temperature extremes sea ice regimes vegetation snow distribution permafrost glaciers lakes rivers and mountain hazards are all the subject of intensive research the highlights of which are reviewed in Canada's Cold Environments Eleven of Canada's leading geographers geologists and ecologists provide an authoritative yet readable scientific statement about the physical nature of Canada's coldness They focus on the distinctive attributes of Canada's cold environments their temporal and spatial variability and the constraints that coldness places on human activity The book is aimed at environmental scientists at all levels who need informed overviews of the substantive findings on a range of cold related topics **North American Terrestrial Vegetation** Michael G. Barbour, William Dwight Billings, 2000 This second edition provides extensively expanded

coverage of North American vegetation from arctic tundra to tropical forests Concise Historical Atlas of Canada Geoffrey J. Matthews, Conrad Heidenreich, Byron Moldofsky, Thomas F. Stuart Chapin III, Robert L.

Jefferies, James F. Reynolds, Gaius R. Shaver, Josef Svoboda, Ellen W. Chu, 2012-12-02 The arctic region is predicted to experience the earliest and most pronounced global warming response to human induced climatic change This book synthesizes information on the physiological ecology of arctic plants discusses how physiological processes influence ecosystem processes and explores how climate warming will affect arctic plants plant communities and ecosystem processes Reviews the physiological ecology of arctic plants Explores biotic controls over community and ecosystems processes Provides physiological bases for predicting how the Arctic will respond to global climate change **Global Climates since the Last Glacial Maximum** H. E. Wright, 1993 Traces the evolution of the global climate since the last period of glacial maximum approximately 18 000 years ago Examines how changes in climate have transformed Earth s biomes in this period and how this change has influenced the evolution of life Dry Creek W. Roger Powers, R. Dale Guthrie, John F. Hoffecker, 2017-04-14 With cultural remains dated unequivocally to 13 000 calendar years ago Dry Creek assumed major importance upon its excavation and study by W Roger Powers The site was the first to conclusively demonstrate a human presence that could be dated to the same time as the Bering Land Bridge As Powers and his team studied the site their work verified initial expectations Unfortunately the research was never fully published Dry Creek The Archaeology and Paleoeology of a Late Pleistocene Alaskan Hunting Camp is ready to take its rightful place in the ongoing research into the peopling of the Americas Containing the original research this book also updates and reconsiders Dry Creek in light of more recent discoveries and analysis Holocene Extinctions Sam Turvey, 2009-05-28 This makes a detailed consideration of these extinctions a useful system for investigating the impacts of human activity over time Forest Development in Cold Climates John Alden, J. Louise Mastrantonio, Soren Ødum, 2013-06-29 As forests decline in temperate and tropical climates highly developed countries and those striving for greater economic and social benefits are beginning to utilize marginal forests of high latitude and mountainous regions for resources to satisfy human needs The benefits of marginal forests range from purely aesthetic to providing resources for producing many goods and services demanded by a growing world population Increased demands for forest resources and amenities and recent warming of high latitude climates have generated interest in reforestation and afforestation of marginal habitats in cold regions Afforestation of treeless landscapes improves the environment for human habitation and provides for land use and economic prosperity Trees are frequently planted in cold climates to rehabilitate denuded sites for the amenity of homes and villages and for wind shelter recreation agroforestry and industrial uses In addition forests in cold climates reduce the albedo of the earth s surface in winter and in summer they are small but significant long lived sinks for atmospheric carbon dioxide Finally growth and reproductive success of forests at their geographic limits are sensitive indices of climatic change As efforts to adapt forests to cold climates increase however new afforestation problems arise and old ones intensify Austral northern and altitudinal tree limits are determined by many different factors Current hypotheses for high latitude tree limits are based on low growing season
