Regulation Of Aldosterone Biosynthesis:

Regulation of Aldosterone Biosynthesis Jürg Müller, 2012-12-06 Most of our knowledge of the physiological control of aldosterone secretion is based on animal experiments and clinical studies which were carried out in the 1950s and early 1960s by a large number of inspired ingenious and meticulous researchers Their work has been excellently reviewed by among others MULLER 1963 BLAIR WEST et al 1963 LARAGH and KELLY 1964 GANONG et al 1966 MULROW 1966 DAVIS 1967 and GROSS 1967 According to the majority of these investigators aldosterone secretion is primarily regulated by the renin angiotensin system with plasma sodium and potassium levels and pituitary secretion of ACTH playing important secondary roles During the last six years this hypothesis has been generally accepted and has only occasionally been challenged The following is an attempt to take from the perspective of a relatively simple in vitro model a new look at the efferent axis of the apparently very complex control system maintaining adequate aldosterone production in the mammalian organism My views are based mainly on a series of experiments which I have performed in order to study more closely the interactions of adrenocortical tissue with substances capable of directly influencing aldosterone biosynthesis Regulation

of Aldosterone Biosynthesis Jürg Müller, 2012-12-06 Sixteen years is a long time not only in human life but also in the rapid history of contemporary endocrinology Since the publication of the first edition of this monograph numerous new lines of research and discoveries have greatly contributed to our knowledge of the physiological and pathological regulation of aldosterone biosynthesis in man and animals The first reports about a sensitive radioimmunoassay for plasma aldosterone and about a preparation of dispersed zona glomerulosa cells were published in 1970 Mayes et al 1970 Haning et al 1970 These two developments alone turned out to have a tremendous impact on research in aldosterone physiology for reviews see Coghlan et al 1979b J F Tait et al 1980b In 1971 atrial natriuretic peptides somatostatin and the precursor molecule of ACTH had not yet been discovered Angiotensin antagonists and converting enzyme inhibitors were not yet available The clinical syndrome of hyporeninemic hypoaldosteronism was unknown The possible roles of prostaglandins and dopamine in the control of aldosterone production had not been considered Cyclic AMP was then the only substance with a clearly established second messenger function

Lipid Second Messengers Ronald P. Rubin, Suzanne Laychock, 1998-11-17 Lipid Second Messengers provides detailed methodology for analysis of various lipid signaling pathways Authoritative contributors explain the factors that regulate lipid second messenger production by agonist activated enzymes and examine their products Topics discussed include procedures used to measure lipid derived mediators such as lysophospholipids arachidonic acid eicosanoids anandamide and ceramides and the enzymes responsible for generating these messengers such as phospholipases prostaglandin endoperoxide synthases and sphingomyelinase

ACTH Action in the Adrenal Cortex: From Molecular Biology to Pathophysiology Nicole Gallo-Payet, Antoine Martinez, André Lacroix, 2017-07-27 By stimulating adrenal gland and corticosteroid synthesis the adrenocorticotrophic hormone ACTH plays a central role in response to stress In this Research Topic a particular attention has been given to the recent developments on adrenocortical zonation the growth promoting activities of ACTH the various steps involved in acute and chronic regulation of steroid secretion by ACTH including the effect of ACTH on circadian rhythms of glucocorticoid secretion The Research Topic also reviews progress and challenges surrounding the properties of ACTH binding to the MC2 receptor MC2R including the importance of melanocortin 2 receptor accessory protein MRAP in MC2R expression and function the various intracellular signaling cascades which involve not only protein kinase A the key mediator of ACTH action but also phosphatases phosphodiesterases ion channels and the cytoskeleton The importance of the proteins involved in the cell detoxification is also considered in particular the effect that ACTH has on protection against reactive oxygen species generated during steroidogenesis The impact of the cellular microenvironment including local production of ACTH is discussed both as an important factor in the maintenance of homeostasis but also in pathological situations such as severe inflammation Finally the Research Topic reviews the role that the pituitary adrenal axis may have in the development of metabolic disorders In addition to mutations or alterations of expression of genes encoding components of the steroidogenesis and signaling pathways chronic stress and sleep disturbance are both associated with hyperactivity of the adrenal gland A resulting effect is increased glucocorticoid secretion inducing food intake and weight gain which in turn leads to insulin and leptin resistance These aspects are described in detail in this Research Topic by key investigators in the field Many of the aspects addressed in this Research

Topic still represent a stimulus for future studies their outcome aimed at providing evidence of the central position occupied by the adrenal cortex in many metabolic functions when its homeostasis is disrupted An in depth investigation of the mechanisms underlying these pathways will be invaluable in developing new therapeutic tools and strategies

Slominski, Michal A. Zmijewski, Cezary Skobowiat, Blazej Zbytek, Radomir M. Slominski, Jeffery D. Steketee, 2012-06-02 The skin the body's largest organ is strategically located at the interface with the external environment where it detects integrates and responds to a diverse range of stressors including solar radiation It has already been established that the skin is an important peripheral neuroendocrine immune organ that is closely networked with central regulatory systems These capabilities contribute to the maintenance of peripheral homeostasis Specifically epidermal and dermal cells produce and respond to classical stress neurotransmitters neuropeptides and hormones production which is stimulated by ultraviolet radiation UVR biological factors infectious and non infectious and other physical and chemical agents Examples of local biologically active products are cytokines biogenic amines catecholamines histamine serotonin and N acetyl serotonin melatonin acetylcholine neuropeptides including pituitary proopiomelanocortin derived ACTH b endorphin or MSH peptides thyroid stimulating hormone and hypothalamic corticotropin releasing factor and related urocortins thyroid releasing hormone hormones as well as enkephalins and dynorphins thyroid hormones steroids glucocorticoids mineralocorticoids sex hormones 7 steroids secosteroids opioids and endocannabinoids The production of these molecules is hierarchical organized along the algorithms of classical neuroendocrine axes such as the hypothalamic pituitary adrenal axis HPA hypothalamic thyroid axis HPT serotonergic melatonergic catecholaminergic cholinergic steroid secosteroidogenic opioid and endocannabinoid systems Disruptions of these axes or of communication between them may lead to skin and or systemic diseases These local neuroendocrine networks also serve to limit the effect of noxious environmental agents to preserve local and consequently global homeostasis Moreover the skin derived factors systems can also activate cutaneous nerve endings to alert the brain to changes in the epidermal or dermal environments or alternatively

to activate other coordinating centers by direct spinal cord neurotransmission without brain involvement Furthermore rapid and reciprocal communications between epidermal and dermal and adnexal compartments are also mediated by neurotransmission including antidromic modes of conduction Lastly skin cells and the skin as an organ coordinate and or regulate not only peripheral but also global homeostasis *Endocrine Hypertension* Karel Pacak, Graeme Eisenhofer, 2002 Several genetic biochemical and radiologic discoveries have impacted the management of endocrine hypertension while surgical procedures have revolutionized treatment of patients with endocrine hypertension This text contains the proceedings of a 2001 workshop on the topic Microcirculation Ronald F.
