Regulatory Peptides And Cognate Receptors:

Regulatory Peptides and Cognate Receptors Dietmar Richter, 2013-06-05 In the last two decades our knowledge on regulatory peptides and their cognate receptors most of which are members of the seven transmembrane receptor families has increased enormously Regulatory peptides are small proteins which besides their hormonal functions in regulating cellular metabolism in various tissues may also act as neurotransmitters and thus they often carry the prefix neuro Many of the cognate receptors involved in transducing the peptidergic signal across the cell membrane via a family of G proteins exist in multiple forms the number of which frequently exceeds that of the corresponding peptide ligands In this book various peptide receptor systems are discussed e g CRF somatostatin TRH opioid peptides vasopressin and oxytocin It also discusses new strategies such as reverse physiology to uncover new peptides and orphan receptors **Trends in Regulatory Peptides** Hubert Vaudry, Marie-Christine Tonon, David Vaudry, 2018-07-24 Regulatory peptides represent the most diverse and versatile family of messenger molecules They are produced by all living organisms from bacteria to mammals They are involved in a wide variety of biological functions Biologically active peptides and their receptors thus constitute an unlimited source of inspiration for the development of innovative drugs and cosmetics. Biology of the NMDA Receptor Antonius M. VanDongen, 2008-10-29 The NMDA receptor plays a critical role in the development of the central nervous system and in adult neuroplasticity learning and memory Therefore it is not surprising that this receptor has been widely studied However despite the importance of rhythms for the sustenance of life this aspect of NMDAR function remains poorly studied Written From Structure to Signalosomes: New Perspectives About Membrane Receptors and Channels Yi Ma, Kai He, Gerald A. Berkowitz, 2019-09-19 Major Histocompatibility Complex (MHC) in Health and Disease Jerzy K. Kulski, Takashi Shiina, Johannes M. Dijkstra, 2020-01-15 The major histocompatibility complex MHC is a highly polymorphic and diverse multigene locus in all jawed vertebrate species that has an integral role in adaptive innate immune systems transplantation and infectious and autoimmune diseases The MHC supra locus in mammalian vertebrates is usually partitioned into three distinct regions known as classes I II and III which to varying extents can be found conserved in nonmammalian jawed vertebrates such as bony fish amphibians and bird lineages The MHC gene region is characterized particularly by the expression of class I and class II glycoproteins that bind peptides derived from intracellular or extracellular antigens to circulating T cells While this expressed antigenic specificity remains the predominant interest with respect to MHC function and polymorphism in a population a broader concept has emerged that examines the MHC as a multifunctional polymorphic controller that facilitates and regulates genome diversity with a much greater array of functions and effects than just MHC restricted antigen recognition This volume of 19 reprints presented by various experts and collected from the Special Issue of Cells on MHC in Health and Disease covers a broad range of topics on the genomic diversity of the MHC regulatory system in various vertebrate species including MHC class I II and III genes innate and adaptive immunity neurology transplantation haplotypes infectious and autoimmune diseases fecundity conservation allelic lineages and evolution Taken together these articles demonstrate the immense complexity and diversity of the MHC structure and function within and between different vertebrate species **Regulation of Pollen Tube Growth,** Volume II Stefano Del Duca, Delia Fernández-González, Giampiero Cai, 2023-07-26
