in today's data focused world      **Relational Database Systems** Joachim W. Schmidt, Michael L. Brodie, 2012-12-06 After a long period of research development test and trial relational database management systems are at last being marketed in force The feedback from early installations of these systems is overwhelmingly positive The most frequent comment by users is that productivity has been increased by a significant factor from 5 to 20 times what it was using previous approaches Another comment is that in many cases end users can now handle their own problems by direct use of the system instead of using application programmers as mediators between them and the system As the reputation of relational systems for ease of use and enhanced productivity has grown there has been a strong temptation for vendors of other approaches to exploit the label relational somewhat indiscriminately In some cases the label is being misapplied to a whole data system in others it is being misapplied to an interface It is therefore worth developing criteria which database management systems DBMSs should have in order to be called relational The Relational Task Group RTG of the American National Standards Institute ANSI undertook such an effort by developing a characterization of RDBMSs and analyzing fourteen DBMSs per this characterization The result of this work is presented in this book The conclusions of the RTG are in agreement with my view that a DBMS should not be called relational unless it satisfies at least the following conditions 1 All information in the database is represented as values in tables
