**Encyclopedia of Planetary Landforms** Henrik Hargitai, Ákos Kereszturi, 2015-08-15 The technique of the mapping of planetary surfaces and the methods used for the identification of various planetary landforms improved much in the last 400 years Until the 20th century telescopic observers could interpret

planetary landforms solely based on their appearance while today various data sets acquired by space probes can be used for a more detailed analysis on the composition and origin of the surface features Before the Greeks the Earth and the Heavens were indisputably of different origin and nature It was a major philosophical breakthrough first appeared as an a priori theory later based on observations that the Heavens planetary bodies and the Earth share common features gravity composition and solar distance may be different but the nature of the physical processes shaping the landforms are essentially the same It has been a long way since we have arrived from the first telescopic description of lunar craters to the identification of various geological formations on Mars or on minor planets Relief features of the Moon have first been observed by Galileo Galilei via his telescope During the next centuries a multitude of Lunar landforms have been identified Theories based on observations have been connected together by a scientific paradigm which explained their origin in a logical and seemingly undisputable manner Telescopes showed a Lunar surface full of circular landforms called craters a landscape with no parallel on Earth But the individual landforms had a morphological equivalent volcanoes which naturally led to the conclusion that craters had been created by volcanic processes Maria seas served as natural basins for water bodies Observations clearly showed that water and air are hardly found on the Moon the lack of clouds indicated the lack of precipitation But the flat surface of the maria obviously composed of marine sediments and the meandering valleys suggested the presence of liquid water and a higher atmospheric pressure in the past during the age of active volcanism and degassing There were no observable active volcanic processes but some craters though to be volcanoes have been observed as being active flashes of light interpreted as eruptions have been reported by several observers The presence of pyroclasts thrown out from the volcanic vents of craters provided an independent evidence meteor showers and individual meteorites falling from the sky originating from Lunar craters The logical and interconnected set of explanations based on observations proved to be completely false by the second half of the 20th century The new paradigm interpreted the very same features in a new context The case of Mars was different There were no telescopes capable of observing relief forms no shadows on Mars are visible from the Earth because Mars always shows a nearly full Mars phase so only albedo features could be seen and used for interpretation The lack of visible relief features were interpreted as a lack of considerable topography an unnoticed distortion in the observational data The hue and contrast of dark and bright orange grey and white spots have changed seasonally the polar areas clearly showed a polar cap made of ice and snow but clouds have not been observed Since Mars is farther away from the Sun than the Earth it was evident that temperature values are lower there Scientists concluded that Mars is an ancient arid world Then contemporary geology taught the theory according to which waters on the Earth are going to infiltrate underground in time making the surface dry observations showed that this had already happened on Mars The last surface reservoirs of water were the polar caps Some observers reported seeing a global network of linear features but other have only seen very few of such albedo markings These features were interpreted as canals made by a

civilization for irrigation carrying water from the poles to all around the flat plains of Mars What was observable from the Earth were the broad stripes of irrigated vegetation like those along the Nile the canals themselves were too narrow to be visible from here All theories converged supposing that the features seen by some but not seen by others were real There was no chance for verification until spacecrafts have been developed which were able to make local observations Instead of canals the first pictures returned revealed a surface full of craters a landform not expected by anyone A paradigm shift was needed to explain the features of the new Mars On the Moon features were observable but the interpretation was wrong On Mars only blurred albedo markings could be observed along with sharp lines of imagination which again were interpreted falsely In the case of Venus there was no data on surface features Only its bright cloud top could be observed from the Earth But this fact along with the planet's orbital parameters provided enough information for a popular view on its surface conditions a hot world inferred from its proximity to the Sun and also a rainy one from its complete cloud cover The conclusion Venus is a global jungle possibly with dinosaurs like the hot and wet world of the then discovered Mesozoic era Our current knowledge originated from these early attempts of interpreting surface conditions and geological origin of landforms from a very little set of available data Today we have a huge set of images and other physical data which makes it possible to create models on the inner structure and thermal history of planetary bodies Combined data sets lead to better supported models on the formation of surface features Today we believe that most models give reliable explanation for the origin of planetary landforms New higher resolution images reveal new sets of meso and microscale landforms while images from previously not imaged dwarf planets satellites asteroids and cometary nuclei show landforms never seen before In the future exoplanets are expected to provide brand new types of relief features not predictable by our Earth and Solar System bound imagination There are so many different landforms on planetary surfaces that it is nearly impossible for anybody to overview all of them who does not work exactly with that certain feature type The Encyclopedia helps with presenting the landforms in searchable alphabetical order The book contains more than a simple list of various features it provides context and connections between them and point to their origin For example sand dunes were found on Venus Mars and Titan fluvial valleys and shorelines are present on Mars and Titan impact craters have many different types all are presented and explained here Beyond the texts references schematic figures images and planetary maps accompany the description of landforms providing a wide background for detailed analyses even for geomorphologists working in planetary science This book is to help the reader to discover the great variety of planetary landforms      *Fundamentals of Soils* John

Gerrard, 2014-05-01 *Fundamentals of Soil* provides a comprehensive and engaging introduction to soils and the workings of soil systems This text is the only one of its kind to provide an attractive lively and accessible introduction to this topic Featuring learning tools within each chapter such as summaries essay questions and guides for further reading the text is also highly illustrated with useful tables boxes and figures Covering all key areas of study at an introductory level subjects

covered include Soil properties Soil processes Controls on soil formation Soil classification World soils Soil patterns Soil degradation

Burt,A.S. Goudie,H.A. Viles,2022-10-20 Co published with British Society for Geomorphology This volume is the fifth in the definitive series The History of the Study of Landforms or the Development of Geomorphology Volume 1 1964 dealt with contributions to the field up to 1890 Volume 2 1973 with the concepts and contributions of William Morris Davis and Volume 3 1991 covered historical and regional themes during the classic period of geomorphology 1890 1950 Volume 4 2008 concentrated on studies of geomorphological processes and Quaternary geomorphology between 1890 and 1965 by the end of this period process based studies had become dominant Volume 5 builds on this platform covering in detail the revolutionary changes in approach that characterized the study of geomorphology in the second half of the twentieth century It is divided into three sections the first deals with changes in approach and method the second with changes in ideas and the broader scientific context within which geomorphology is studied and the final section details advances in research on processes and landforms The volume s objective is to describe and analyse many of the developments that provide a foundation for the rich and varied subject matter of twenty first century geomorphology

**Human Activities and the Tropical Rainforest** Bernard K. Maloney,2013-11-11 Arising initially from a conference the papers published here have been integrated into book form to provide information on human activities and the tropical rainforest in the past and present and on the possible future of the rainforest in a unique way Other books have considered some but not all of these themes however none has stressed the continuity of change over time and its possible outcome for the people of the forest as well as for the forest itself Because of the approach taken this book should appeal across traditional disciplinary boundaries Indeed a prime aim has been to suggest that rainforest because of its complexity and the complexity of people rainforest relationships throughout time deserves study from a broad perspective This book poses more questions than answers about the rainforest and it is hoped that it will encourage readers to think about the rainforest in a wider way than hitherto This book is aimed at geographers physical and human social anthropologists archaeologists pedologists foresters and tropical botanists and will be of value to graduates of various disciplines setting out to research the rainforest *Fundamentals of Geomorphology* Richard J. Huggett,2003 This text presents a comprehensive introduction to geomorphology exploring the world s landforms from a systems perspective with an emphasis on change

*Rocks and Landforms* John Gerrard,2012-12-06 Geomorphology can be defined simply as the study of landforms Landforms are the result of the interaction between what Ritter 1978 has called the driving and resisting forces The driving forces or processes are the methods by which energy is exerted on earth materials and include both surface geomorphological or exogenous processes and subsurface geological or endogenous processes The resisting forces are the surface materials with their inherent resistances determined by a complex combination of rock properties Stated in these

simple terms it would be expected that both sides of the equation be given equal weight in syntheses of landform evolution. However, this has not been the case. Until about the 1950s, geomorphology was mainly descriptive and concerned with producing time-dependent models of landscape evolution. Although the form of the land was the main focus, there was little detailed mention of process and scant attention to the properties of surface materials. There were, of course, exceptions. In the late 19th century, G. K. Gilbert was stressing the equilibrium between landforms and processes. Many hydrologists were examining the detailed workings of river systems and drainage basins, culminating in the classic paper of Horton (1945).

Environmental Change Richard Huggett, 2003-09-02. Huggett presents an introductory exploration of past, present, and future change in the environment. Exploring rates and directions of change introduces the interdependent parts of the natural environment.
