Regression Periods In Human Infancy:

Regression Periods in Human infancy Mikael Heimann, Frans X. Plooij, 2003-10-17 Regression periods play a central role in the psychological development of the human baby Studies of infants have identified 10 periods of regression or a return to a high frequency of mother infant contact within the first 20 months of life These periods of emotional insecurity in the child signal forthcoming periods of developmental advance and the emergence of an array of new skills as a consequence of parent infant conflict over body contact and the renegotiation of old privileges Although the basic idea in this book is an old one the authors believe that regression periods deserve further study and have identified four questions of central importance today Can the phenomenon of regression periods as found by Dutch researchers in 1992 be replicated in other countries and cultures What environmental conditions have an effect on these regression periods and how Are there physical conditions in infants that show a non linear distribution over age similar to regression periods Have brain changes been detected since the review of Fischer Rose 1994 at other ages than the six reported by them and if yes how do these relate to the ages at which regression periods are found Forming the core of this book the replication studies performed in Sweden Spain and England provide support that regression periods are a reliable phenomenon and should be dealt with accordingly whenever developmental processes in infancy are discussed

Imitation from Infancy Through Early Childhood Mikael Heimann, 2022-08-30 This book summarizes more than four decades of research on imitation in infancy and its relation to early learning and sociocognitive development in typically and atypically developing children The studies were carried out in a Scandinavian context and thus provide important cultural validation of the central developmental processes The book is divided into three parts Part one focuses on the social and cognitive aspects of imitation discussing links to early parent infant interaction and developmental meaning It addresses evidence for an imitative capacity at birth for typical and atypical infants Also covered are early individual differences in imitation the role of imitation as a social and cognitive learning mechanism in early development and possible links between imitation and temperament Part two presents unique longitudinal studies on early memory development using deferred imitation as the key method It discusses the biological basis of memory and explores the idea that deferred imitation is an indicator of an infant's ability to understand intentions Part three focuses on imitation in young children with autism and with Down syndrome It examines the role of imitation as a deficit as well as a vehicle for change when used interactively in early interventions for children with autism Imitation from Infancy Through Early Childhood is an essential resource for researchers professors and graduate students as well as clinicians and other professionals in developmental psychology cognitive development psycholinguistics child psychiatry and developmental neuroscience

Understanding the Under 3s and the Implications for Education Sylvie Rayna, Ferre Laevers, 2016-04-08 This book originated from an awareness of the persistent lack of knowledge supporting a more respectful reception and approach to the youngest in our changing societies It follows initiatives of networks of

researchers from several countries sharing insights from current studies carried out in their different cultures Introduced by a state of art review like chapter on birth to 3 literature the book which can be pictured as a composition begins with a journey inside the creativity of these young persons and a picture of a companionable learning It deals with the role of the spatial and physical dimensions of the setting and pictures how the educator can create meaningful participation and launch early exercises in democracy with respect for diversities It provides a deeper understanding of a pedagogical accompaniment based on participatory alliance and of the development of communication and language The text will be a useful addition to researchers practitioners and other stakeholders This book was originally published as a special issue of the European Early Childhood Education Research Journal Evolution, Early Experience and Human Development Darcia Narváez,2012-11-29

The field of cognitive psychology has expanded rapidly in recent years with experts in affective and cognitive neuroscience revealing more about mammalian brain function than ever before In contrast psychological problems such as ADHD autism anxiety and depression are on the rise as are medical conditions such as diabetes obesity and autoimmune disorders Why in this era of unprecedented scientific self knowledge does there seem to be so much uncertainty about what human beings need for optimal development Evolution Early Experience and Human Development asserts that human development is being misshaped by government policies social practices and public beliefs that fail to consider basic human needs In this pioneering volume scientists from a range of disciplines theorize that the increase in conditions such as depression and obesity can be partially attributed to a disparity between the environments and conditions under which our mammalian brains currently develop and our evolutionary heritage For example healthy brain and emotional development depends to a significant extent upon caregiver availability and quality of care These include practices such as breastfeeding co sleeping and parental social support which have waned in modern society but nevertheless may be integral to healthy development As the authors argue without a more informed appreciation of the ideal conditions under which human brains minds develop and function human beings will continue to struggle with suboptimal mental and physical health and as problems emerge psychological treatments alone will not be effective The best approach is to recognize these needs at the outset so as to optimize child development Evolution Early Experience and Human Development puts forth a logical empirically based argument regarding human mammalian needs for optimal development based on research from anthropology neurobiology animal science and human development The result is a unique exploration of evolutionary approaches to human behavior that will support the advancement of new policies new attitudes towards health and alterations in childcare practices that will better promote healthy human development Emotional Development Jacqueline Nadel,Darwin Muir,2005 A group of scientists consider emotional development from foetal life onwards The text includes views from neuroscience primatology robotics psychopathology and prenatal development **Contexts for Young Child Flourishing** Darcia Narváez,2016

Contexts for Young Child Flourishing uses an evolutionary systems framing to address the conditions and contexts for child

experiences Phenomenology of the Newborn is an essential text for researchers seeking to employ phenomenology for the study of neonatal life and related concerns that may seem inaccessible to other more traditional qualitative and quantitative methods *The Blackwell Companion to Consciousness* Susan Schneider,Max Velmans,2017-03-16 Updated and revised the highly anticipated second edition of *The Blackwell Companion to Consciousness* offers a collection of readings that together represent the most thorough and comprehensive survey of the nature of consciousness available today Features updates to scientific chapters reflecting the latest research in the field Includes 18 new theoretical empirical and methodological chapters covering integrated information theory renewed interest in panpsychism and more Covers a wide array of topics that include the origins and extent of consciousness various consciousness experiences such as meditation and drug induced states and the neuroscience of consciousness Presents 54 peer reviewed chapters written by leading experts in the study of consciousness from across a variety of academic disciplines
