*Clinical Pathways in Stroke Rehabilitation* Thomas Platz, 2021-01-14 This open access book focuses on practical clinical

problems that are frequently encountered in stroke rehabilitation. Consequences of diseases e.g. impairments and activity limitations are addressed in rehabilitation with the overall goal to reduce disability and promote participation. Based on the available best external evidence, clinical pathways are described for stroke rehabilitation, bridging the gap between clinical evidence and clinical decision making. The clinical pathways answer the questions which rehabilitation treatment options are beneficial to overcome specific impairment constellations and activity limitations and are well acceptable to stroke survivors as well as when and in which settings to provide rehabilitation over the course of recovery post stroke. Each chapter starts with a description of the clinical problem encountered. This is followed by a systematic but concise review of the evidence: RCTs, systematic reviews and meta-analyses that is relevant for clinical decision making and comments on assessment, therapy, training, technology, medication and the use of technical aids as appropriate. Based on these summaries, clinical algorithms/pathways are provided and the main clinical decision situations are portrayed. The book is invaluable for all neurorehabilitation team members: clinicians, nurses and therapists in neurology, physical medicine and rehabilitation and related fields. It is a World Federation for NeuroRehabilitation (WFNR) educational initiative bridging the gap between the rapidly expanding clinical research in stroke rehabilitation and clinical practice across societies and continents. It can be used for both clinical decision making for individuals and as well as clinical background knowledge for stroke rehabilitation service development initiatives.

*Cognitive Rehabilitation Therapy for Traumatic Brain Injury* Institute of Medicine, Board on the Health of Select Populations, Committee on Cognitive Rehabilitation Therapy for Traumatic Brain Injury, 2012-01-28

Traumatic brain injury (TBI) may affect 10 million people worldwide. It is considered the signature wound of the conflicts in Iraq and Afghanistan. These injuries result from a bump or blow to the head or from external forces that cause the brain to move within the head, such as whiplash or exposure to blasts. TBI can cause an array of physical and mental health concerns and is a growing problem, particularly among soldiers and veterans because of repeated exposure to violent environments. One form of treatment for TBI is cognitive rehabilitation therapy (CRT), a patient-specific, goal-oriented approach to help patients increase their ability to process and interpret information. The Department of Defense asked the IOM to conduct a study to determine the effectiveness of CRT for treatment of TBI.

**Translational Research in Traumatic Brain Injury** Daniel Laskowitz, Gerald Grant, 2016-04-21

Traumatic brain injury (TBI) remains a significant source of death and permanent disability, contributing to nearly one third of all injury-related deaths in the United States and exacting a profound personal and economic toll. Despite the increased resources that have recently been brought to bear to improve our understanding of TBI, the development of effective treatments remains a challenge.
