Reinforcement Behavioral Analyses:

Schedules of Reinforcement B. F. Skinner, C. B. Ferster, 2015-05-20 The contingent relationship between actions and their consequences lies at the heart of Skinner's experimental analysis of behavior. Particular patterns of behavior emerge depending upon the contingencies established. Ferster and Skinner examined the effects of different schedules of reinforcement on behavior. An extraordinary work, *Schedules of Reinforcement* represents over 70 000 hours of research primarily with pigeons though the principles have now been experimentally verified with many species including human beings. At first glance the book appears to be an atlas of schedules. And so it is the most exhaustive in existence. But it is also a reminder of the power of describing and explaining behavior through an analysis of measurable and manipulative behavior environment relations without appealing to physiological mechanisms in the brain. As an exemplar and source for the further study of behavioral phenomena the book illustrates the scientific philosophy that Skinner and Ferster adopted: that a science is best built from the ground up from a firm foundation of facts that can eventually be summarized as scientific laws. *The Verbal Behavior Approach* Mary Lynch Barbera, Tracy Rasmussen, 2007 The Verbal Behavior (VB) approach is a form of Applied Behavior Analysis that is based on B. F. Skinner's analysis of verbal behaviour. In this book Barbera draws on her experiences as a Board Certified Behavior Analyst and also as a parent of a child with autism to explain VB and how to use it. *The Matching Law* Richard J. Herrnstein, 1997 This impressive collection features Richard Herrnstein's most important and original contributions to the social and behavioral sciences: his papers on choice behavior in animals and humans and on his discovery and elucidation of a general principle of choice called the matching law. In recent years the most popular theory of choice behavior has been rational choice theory. Developed and elaborated by economists over the past hundred years it claims that individuals make choices in such a way as to maximize their well being or utility under whatever constraints they face: that is, people make the best of their situations. Rational choice theory holds undisputed sway in economics and has become an important explanatory framework in political science, sociology and psychology. Nevertheless its empirical support is thin. The matching law is perhaps the most important competing explanatory account of choice behavior. It views choice not as a single event or an internal process of the organism but as a rate of observable events over time. It states that instead of maximizing utility the organism allocates its behavior over various activities in exact proportion to the value derived from each activity. It differs subtly but significantly from rational choice theory in its predictions of how people exert self control for example how they decide whether to forgo immediate pleasures for larger but delayed rewards. It provides through the primrose path hypothesis a powerful explanation of alcohol and narcotic addiction. It can also be used to explain biological phenomena such as genetic selection and foraging behavior as well as economic decision making.
