

# Effects and Causes of Global Warming and Climate Change

We are all told the effects of the dooming, inevitable climate change. The first images sparked in our minds are of a dried up, dusty ocean and a sad polar bear swimming. And when we think of these extreme examples we can easily find solace in seeing our actual world and its seemingly mild changes. The thought, "Well it's not that bad" comes to mind when looking out your window. However, if you pay more attention, the very real and rapidly worsening changes in our world are astounding. These changes affect all aspects and categories of our environment: land, sea, and air. Ocean Acidification, Drought, and Natural Disasters are all prominent examples of the diversity of these changes, each caused by obscenely high carbon dioxide levels.

Known as "Climate Change's equally evil twin," The Ocean Portal Team, Ocean Acidification is causing carnage to marine life. Ocean Acidification is the continual decrease in the ocean's pH levels, which is caused by the carbon dioxide from the air dissolving into the seawater. The carbonic acid is primarily stored in the deepest parts of the ocean, not really affecting the shallower levels, where most animals live. So where is the problem? Upwelling is a natural current that raises the deep water to the surface. This occurs when the winds along the coast, push the shallow levels away, therefore causing the deep water to replace the shallow. So, when this upwelling happens, the carbonic acid comes to the surface, where it wrecks havoc on the ecosystem. What is important to remember is that, according to NOAA Pacific Marine Environmental Laboratory, the ocean is absorbing 1/3rd of the world's carbon dioxide-which is roughly 22 million tons a day.

The ocean does have a process in which it can naturally balance its pH levels, called Buffering. However, there is too much carbon dioxide being absorbed, and as a result, the ocean cannot keep up in rebalancing itself. Because of this imbalance, marine life is suffering. Due to the pH levels lowering, the water is becoming more and more acidic, causing shell erosion of clams, oysters, urchins, and pteropods. These protective shells are mainly made of calcium carbonate, a normally insoluble compound. However, in the increasingly acidic water, the shells are becoming more and more soluble, causing these now unprotected animals to die in record numbers. One of these animals being Pteropods, who might seem a bit unimportant. However, because of their place on the food chain being at the very bottom, they are therefore the foundation of all other animals food supply. The Pteropods are just one example out of countless others.

A common misconception from people regarding animal habitats being destroyed, is, "Well, animals can adapt." Yes, they can. However, they are unable to adapt as fast as their environments are changing. It is crucial to remember that these problems are not getting fixed, they are getting worse by the day, and are b

*Climate Change Education* National Research Council, Division of Behavioral and Social Sciences and Education, Board on Science Education, 2012-01-12 The global scientific and policy community now unequivocally accepts that human activities cause global climate change Although information on climate change is readily available the nation still seems unprepared or unwilling to respond effectively to climate change due partly to a general lack of public understanding of climate change issues and opportunities for effective responses The reality of global climate change lends increasing urgency to the need for effective education on earth system science as well as on the human and behavioral dimensions of climate change from broad societal action to smart energy choices at the household level The public s limited understanding of climate change is partly the result of four critical challenges that have slowed development and delivery of effective climate change education As one response to these challenges Congress in its 2009 and 2010 appropriation process requested that the National Science Foundation NSF create a program in climate change education to provide funding to external grantees to improve climate change education in the United States To support and strengthen these education initiatives the Board on Science Education of the National Research Council NRC created the Climate Change Education Roundtable The Roundtable convened two workshops Climate Change Education Goals Audiences and Strategies is a summary of the discussions and presentations from the first workshop held October 21 and 22 2010 This report focuses on two primary topics public understanding and decision maker support It should be viewed as an initial step in examining the research on climate change and applying it in specific policy circumstances
