

Release of cases from isolation

Information for clinicians

Updated 1 April 2022

Clinicians may see patients presenting with COVID-19 symptoms that persist beyond the 7-day isolation period, or who are significantly immunocompromised and may require longer isolation periods and further testing. This factsheet provides guidance on assessing those patients for release from isolation.

Guidance for release from isolation

A person who has tested positive for COVID-19 by polymerase chain reaction (PCR) or rapid antigen test (RAT) must isolate at home for a full seven (7) days, from the date the positive test was taken. Day 0 is the date of the positive test; Day 1 is the first full day after the positive test was taken. For example, if the case took the test at 10am on 7 February, their isolation period finishes at 10 am on 14 February.

Following a positive COVID-19 test, further testing during the 7-day isolation period or to guide exit from isolation is not routinely recommended.

Asymptomatic cases

- If a person with COVID-19 has no symptoms after completing 7 days of isolation, they may leave isolation.

Symptomatic cases

- If a person with COVID-19 continues to have symptoms, but the acute respiratory symptoms have resolved by the end of the 7-day isolation period, they may leave isolation.
- If a person with COVID-19 continues to have acute respiratory symptoms after completing 7 days of isolation, the person should remain in isolation until their acute respiratory symptoms have resolved.

Guidance on assessing 'acute respiratory symptoms'

The below guidance applies to patients with COVID-19 who continue to experience acute respiratory symptoms after having completed 7 days of isolation.

- Acute respiratory symptoms refer to symptoms which can reasonably be attributed to COVID-19 and in most individuals would not be expected to persist beyond the acute phase. For this purpose, acute respiratory symptoms include:
 - frequent coughing
 - sore throat
 - shortness of breath
 - runny nose
 - acute blocked nose (congestion)
- If the cause of ongoing symptoms is due to a chronic underlying condition, such as allergic rhinitis or asthma, the person may leave isolation if the chronic symptoms have returned to their usual baseline or can be attributed to the chronic condition.

Guidelines for Vapor Release Mitigation Richard W. Prugh, Robert W. Johnson, 2010-09-16 Guidelines for Vapor Release Mitigation is a survey of current industrial practice for controlling accidental releases of hazardous vapors and preventing their escape from the source area *Guidelines for Determining the Probability of Ignition of a Released Flammable Mass* CCPS (Center for Chemical Process Safety), 2014-06-26 Complemented by an estimating tool spreadsheet based on a fixed set of chemicals to assist in risk estimations Probability of Ignition of a Released Flammable Mass converts a best guess to a calculated value based on available information and current technology The text documents and explains the science and background of the technology based approach The tool when populated with appropriate data yields an estimate of the probability that a defined release of a flammable material will ignite if exposed to an ignition source This information can be used to make risk assessments with a higher degree of confidence than estimates made before and it provides valuable information for use in the development of a facility's Emergency Response Plan Official Documents, Comprising the Department and Other Reports Made to the Governor, Senate, and House of Representatives of Pennsylvania Pennsylvania, 1903 **Reprint from the Public Health Reports** United States. Report of the Department of Health Connecticut. State Dept. of Health, 1902 *Developmental Psychobiology* Elliott M. Blass, 2012-12-06 ELLIOTT M BLASS Fifteen years have passed since the first volume on developmental psychobiology Blass 1986 appeared in this series and 13 since the publication of the second volume Blass 1988 These volumes documented the status of the broad domain of scientific inquiry called developmental psychobiology and were also written with an eye to the future The future has been revolutionary in at least three ways First there was the demise of a descriptive ethology as we had known it to be replaced first by sociobiology and later by its more sophisticated versions based on quantitative predictions of

social interactions that reflected relatedness and inclusive fitness. Second, there was the emergence of cognitive science, including cognitive development as an enormously strong and interactive multidisciplinary effort. Making the functional brain more accessible made this revolution all the more relevant to our discipline. In the laboratory, immunocytochemical detection of immediate early genes such as *c-fos* now allows us to trace neuronal circuits activated during complex behaviors. The functional brain of primates, especially humans, was also made very accessible through neuroimaging with which we can look at and into brains as they solve and attempt to solve particular tasks. Those of us who were trained in neurology as graduate students two or three decades ago recognize only the people in white coats and patients in beds or on gurneys when we visit neurological units today. The rest is essentially new.
