Kunii, 2012-12-06 Computer graphics as a whole is an area making very fast progress and it is not easy for anyone including experts to keep abreast of the frontiers of its various basic and application fields By issuing over 100 thousand calls for papers through various journals and magazines as well as by inviting reputed specialists and by selecting high quality papers which present the state of the art in computer graphics out of many papers thus received this book *Frontiers in Computer Graphics* has been compiled to present the substance of

progress in this field This volume serves also as the final version of the Proceedings of Computer Graphics Tokyo 84 Tokyo Japan April 24 27 1984 which as a whole attracted 16 thousand participants from all over the world about two thousand to the conference and the remaining 14 thousand to the exhibition This book covers the following eight major frontiers of computer graphics in 29 papers 1 geometry modelling 2 graphic languages 3 visualization techniques 4 human factors 5 interactive graphics design 6 CAD CAM 7 graphic displays and peripherals and 8 graphics standardization Geometry modelling is most essential in displaying any objects in computer graphics It determines the basic capabilities of computer graphics systems such as whether the surface and the inside of the object can be displayed and also how efficiently graphical processing can be done in terms of processing time and memory space Parallel Algorithms and Architectures for DSP Applications Magdy A. Bayoumi, 2012-12-06 Over the past few years the demand for high speed Digital Signal Processing DSP has increased dramatically New applications in real time image processing satellite communications radar signal processing pattern recognition and real time signal detection and estimation require major improvements at several levels algorithmic architectural and implementation These performance requirements can be achieved by employing parallel processing at all levels Very Large Scale Integration VLSI technology supports and provides a good avenue for parallelism Parallelism offers efficient solutions to several problems which can arise in VLSI DSP architectures such as 1 Intermediate data communication and routing several DSP algorithms such as FFT involve excessive data routing and reordering Parallelism is an efficient mechanism to minimize the silicon cost and speed up the processing time of the intermediate middle stages 2 Complex DSP applications the required computation is almost doubled Parallelism will allow two similar channels processing at the same time The communication between the two channels has to be minimized 3 Application specific systems this emerging approach should achieve real time performance in a cost effective way 4 Testability and fault tolerance reliability has become a required feature in most of DSP systems To achieve such property the involved time overhead is significant Parallelism may be the solution to maintain acceptable speed performance
