Quaternary Extinctions A Prehistoric Revolution:

Quaternary Extinctions Paul S. Martin, Richard G. Klein, 1989-01-01 What caused the extinction of so many animals at or near the end of the Pleistocene Was it overkill by human hunters the result of a major climatic change or was it just a part of some massive evolutionary turnover Questions such as these have plagued scientists for over one hundred years and are still being heatedly debated today Quaternary Extinctions presents the latest and most comprehensive examination of these questions Geological Magazine May be regarded as a kind of standard encyclopedia for Pleistocene vertebrate paleontology for years to come American Scientist Should be read by paleobiologists biologists wildlife managers ecologists archeologists and anyone concerned about the ongoing extinction of plants and animals Science Uncommonly readable and varied for watchers of paleontology and the rise of humankind Scientific American Represents a quantum leap in our knowledge of Pleistocene and Holocene palaeobiology Many volumes on our bookshelves are destined to gather dust rather than attention But not this one Nature Two strong impressions prevail when first looking into this epic compendium One is the judicious balance of views that range over the whole continuum between monocausal cultural or environmental explanations The second is that both the data base and theoretical sophistication of the protagonists in the debate have improved by a quantum leap since 1967 American Anthropologist Twilight of the Mammoths Paul S. Martin, 2007-05-08 Paul S Martin s innovative ideas on late quaternary extinctions and wildlife restoration have fueled one of science s most stimulating recent debates He expounds them vividly here and defends them eloquently A must read David Rains Wallace author of Beasts of Eden This is a marvelous read by a giant in American prehistory about one of the greatest mysteries in the earth sciences Tim Flannery author of The Eternal Frontier Whether or not you agree with Paul Martin he has shaped how we think about our Pleistocene ancestors and their role in transforming this planet Ross D E MacPhee Curator of Mammalogy American Museum of Natural History *Extinctions in Near Time* Ross D.E. MacPhee, Hans-Dieter Sues, 2013-11-09 Near time an interval that spans the last 100 000 years or so of earth history qualifies as a remarkable period for many reasons From an anthropocentric point of view the out standing feature of near time is the fact that the evolution cultural diversification and glob al spread of Homo sapiens have all occurred within it From a wider biological perspective however the hallmark of near time is better conceived of as being one of enduring repeat ed loss The point is important Despite the sense of uniqueness implicit in phrases like the biodiversity crisis meant to convey the notion that the present bout of extinctions is by far the worst endured in recent times substantial losses have occurred throughout near time In the majority of cases these losses occurred when and only when people began to ex pand across areas that had never before experienced their presence Although the explana tion for these correlations in time and space may seem obvious it is one thing to rhetori cally observe that there is a connection between humans and recent extinctions and quite another to demonstrate it scientifically How should this be done Traditionally the study of past extinctions has fallen largely to researchers steeped in such disciplines as

paleontology systematics and paleoecology The evaluation of future losses by contrast has lain almost exclusively within the domain of conservation biologists Now more than ever there is opportunity for overlap and sharing of information End of the Megafauna: The Fate of the World's Hugest, Fiercest, and Strangest Animals Ross D E MacPhee, 2018-11-13 The fascinating lives and puzzling demise of some of the largest animals on earth Until a few thousand years ago creatures that could have been from a sci fi thriller including gorilla sized lemurs 500 pound birds and crocodiles that weighed a ton or more roamed the earth These great beasts or megafauna lived on every habitable continent and on many islands With a handful of exceptions all are now gone What caused the disappearance of these prehistoric behemoths No one event can be pinpointed as a specific cause but several factors may have played a role Paleomammalogist Ross D E MacPhee explores them all examining the leading extinction theories weighing the evidence and presenting his own conclusions He shows how theories of human overhunting and catastrophic climate change fail to account for critical features of these extinctions and how new thinking is needed to elucidate these mysterious losses Along the way we learn how time is determined in earth history how DNA is used to explain the genomics and phylogenetic history of megafauna and how synthetic biology and genetic engineering may be able to reintroduce these giants of the past Until then gorgeous four color illustrations by Peter Schouten re create these megabeasts here in vivid detail **Prehistoric Native Americans and Ecological Change** Paul A. Delcourt, Hazel R. Delcourt, 2004-07-29 This book shows that Holocene human ecosystems are complex adaptive systems in which humans interacted with their environment in a nested series of spatial and temporal scales Using panarchy theory it integrates paleoecological and archaeological research from the Eastern Woodlands of North America providing a paradigm to help resolve long standing disagreements between ecologists and archaeologists about the importance of prehistoric Native Americans as agents for ecological change The authors present the concept of a panarchy of complex adaptive cycles as applied to the development of increasingly complex human ecosystems through time They explore examples of ecological interactions at the level of gene population community landscape and regional hierarchical scales emphasizing the ecological pattern and process involving the development of human ecosystems Finally they offer a perspective on the implications of the legacy of Native Americans as agents of change for conservation and ecological restoration efforts today Ice Age Mammals of North America Ian M. Lange, 2017 Lange untangles the complex evolutionary lineages of mammal families including the gomphotheres elephant like creatures that coexisted with humans at the end of the Pleistocene You ll learn about the geologic events that led to the ice ages along with possible causes for the mass extinctions of so many species **Mass Extinction** Ashraf M.T. Elewa, 2007-12-03 The present book combines three main aspects five major mass extinctions contributions on some other minor extinctions and more importantly contributions on the current mass extinction All three aspects are introduced through interesting studies of mass extinctions in diverse organisms ranging from small invertebrates to mammals and take account of the most accepted subjects discussing mass extinctions in insects mammals

fishes ostracods and molluscs **Islands** Peter Vitousek, Lloyd L. Loope, Hennig Adersen, 2013-03-08 Oceanic islands represent a set of systems in which biological diversity varies as a consequence of remoteness or size not environment they are also generally simpler than continental ecosystems Islands therefore provide an opportunity to determine the direct effects of biological diversity on ecosystem function The volume addresses the components of biological diversity on islands and their patterns of variation the modern threats to the maintenance of biological diversity on islands the consequences of island biology and its modification by humanity regarding aspects of ecosystem function the global implications of islands for conservation and how islands can help one to understand the processes inducing changes throughout the world *Faunal Extinction in an Island Society* Alan H. Simmons, 2006-01-22 The multidisciplinary research program at Akrotiri Aetokremnos is important in my opinion for three reasons two empirical and one conceptual Quite apart from the archaeology work at the site is a major contribution to island biogeography in that the Phanourios sample certainly the best from Cyprus and probably the best anywhere in the world has already provided and will continue to provide important ecological and behavioral data on these intriguing creatures Dwarfed island faunas are important to our understanding of the complex factors that shape natural selection in ecologically closed environments over the evolutionary long term At Aetokremnos we seem to have the end of a long sequence of hippo evolution on the island With comparative studies of other Cypriot hippo faunas we should be able to pin down the interval of initial colonization by what were presumably normal sized hippos and if the other sites can be dated document the dwarfing process in considerable detail Aetokremnos would still be a significant paleontological locality even in the absence of evidence of a human presence there While reading the text of the monograph a number of questions strictly related to the paleontology occurred to me One was how to model the colonization process There seems to be little question that the large mammals colonized the island by swimming to it because I gather Cyprus has not been connected to the mainland for roughly 5.6 million years *The Archaeology and Paleoecology of the Aubrey Clovis Site (41DN479) Denton County, Texas* C. Reid Ferring, 2001 *Native Americans and the Environment* Michael Eugene Harkin, David Rich Lewis, 2007-01-01 Often cited as one of the most decisive campaigns in military history the Seven Days Battles were the first campaign in which Robert E. Lee led the Army of Northern Virginia as well as the first in which Lee and Thomas Stonewall Jackson worked together **Mass Extinctions and Their Aftermath** A. Hallam, P. B. Wignall, 1997-09-11 Why do mass extinctions occur The demise of the dinosaurs has been discussed exhaustively but has never been put into the context of other extinction events This is the first systematic review of the mass extinctions of all organisms plant and animal terrestrial and marine that have occurred in the history of life This includes the major crisis 250 million years ago which nearly wiped out all life on Earth By examining current paleontological geological and sedimentological evidence of environmental changes the cases for explanations based on climate change marine regressions asteroid or comet impact anoxia and volcanic eruptions are all critically evaluated *The Early Settlement of North America* Gary Haynes, 2002-11-14 The Early

Settlement of North America is an examination of the first recognisable culture in the New World the Clovis complex Gary Haynes begins his analysis with a discussion of the archaeology of Clovis fluted points in North America and a review of the history of the research on the topic He presents and evaluates all the evidence that is now available on the artefacts the human populations of the time and the environment and he examines the adaptation of the early human settlers in North America to the simultaneous disappearance of the mammoths and mastodonts Haynes offers a compelling re appraisal of our current state of knowledge about the peopling of this continent and provides a significant new contribution to the debate with his own integrated theory of Clovis which incorporates vital new biological ecological behavioural and archaeological data

Ancient Peoples of the Great Basin and Colorado Plateau Steven R Simms, 2016-07 Written to appeal to professional archaeologists students and the interested public alike this book is a long overdue introduction to the ancient peoples of the Great Basin and northern Colorado Plateau Through detailed syntheses the reader is drawn into the story of the habitation of the Great Basin from the entry of the first Native Americans through the arrival of Europeans Ancient Peoples is a major contribution to Great Basin archaeology and anthropology as well as the general study of foraging societies

Archaeology on the Great Plains W. Raymond Wood, 1998 This synthesis of Great Plains archaeology brings together what is currently known about the inhabitants of the ancient Plains The essays review the Paleo Indian Archaic Woodland and Plains Village peoples providing information on technology diet settlement and adaptive patterns

Frozen in Time Michael Oard, 2004-11-01 Earth's past is littered with the mysterious and unexplained the pyramids Easter Island Stonehenge dinosaurs and the list goes on and on as science looks for clues to decipher these puzzles One such mystery surrounds the now extinct creature called the woolly mammoth Author and meteorologist Michael Oard has studied the mammoth and its equally mysterious time period the Ice Age for many years and has come to some fascinating conclusions to help lift the fog engulfing the facts Some of the questions he addresses include What would cause the summer temperatures of the northern United States and European to plummet more than 50 degrees Fahrenheit Why did mammoths become extinct across the entire earth at the same time as many other large mammals Why are the mammoth carcasses found generally in standing positions How could large lakes exist in what are today very dry desert like places What was the source of the abnormal of moisture necessary for heavy snow What caused the cold summer temperatures and heavy snowfall to persist for hundreds of years In logical progression many other Ice Age topics are explained including super Ice Age floods ice cores man in the Ice Age and the number of ice ages This is one of the most difficult eras in geological history for a uniformitarian scientist one who believes the earth evolved by slow processes over millions of years to explain simply because long ages of evolution cannot explain it Provided here are plausible explanations of the seemingly unsolvable mysterious about the Ice Age and the woolly mammoths

Frozen in Time

The World Environment 1972-1992 O. El-Kholy, 2012-12-06 Our planet is under siege Assaults on the atmosphere the greenhouse effect the depletion of the ozone layer and increasing air pollution pose a

still unquantified threat to human life The dumping of hazardous wastes and land based sources of pollution present a similar threat to the oceans On land we are destroying a tropical forest the size of Austria every year and more than a hundred species of wild plants and animals are lost forever each day When the General Assembly of the United Nations established UNEP it charged us with reporting on the changing state of the world s environment tracking the underlying causes of change and working with governments to develop responses to those changes Every year since 1974 UNEP has produced a State of the Environment report focusing on one or more emerging environmental issues and always stressing the human factor the impact of environmental quality on people and society Three times since its inception 1982 198 7 and 1992 UNEP has undertaken a more wide ranging study The results of the present study are the most disturbing of the three However not all the signs are negative Throughout the 19 70s and into the 1980s UNEP was able to report progress in some important areas Environmental monitoring capacity was being rapidly improved in many parts of the world and Ministries of the Environment were being set up in an attempt to deal with environmental threats in a more coherent way

Environment and Development Stavros G. Pouloupoulos,Vassilis J. Inglezakis,2016-05-23 Environment and Development Basic Principles Human Activities and Environmental Implications focuses on the adverse impact that human activities developments and economic growth have on both natural and inhabited environments The book presents the associated problems along with solutions that can be used to achieve a harmonic sustainable development that provides for the co existence of man and natural life Chapters provide detailed information on a range of environments including atmospheric aquatic soil natural urban energy and extraterrestrial as well as the relationship between the environment and development In addition this comprehensive book presents the latest research findings and trends in global environmental policy for each issue Offers a discussion of the extraterrestrial environment and waste in earth orbit as one of the distinctive topics of the book Addresses global environmental policy issues and policies Presents tabulated data to support the analysis and explain the issues presented Includes case studies covering many topics of current interest Analyzes environmental issues and proposes solutions grounded in recent research findings Discusses the various interpretations of the development concept as well as alternative pathways to sustainable development

Burning Bush Stephen J. Pyne,2015-09-14 Pyne traces the impact of fire in Australia from its influence on vegetation to its use by Aborigines and European settlers Mr Pyne showing what a historian deeply schooled in environmental science can contribute to our awareness of nature and culture has produced a provocative work that is a major contribution to the literature of environmental studies New York Times Book Review

Past and Future Rapid Environmental Changes Brian Huntley,Wolfgang Cramer,Alan V. Morgan,Honor C. Prentice,Judy R.M. Allen,2013-06-29 Numerous experts including ecologists geneticists paleontologists and climatologists investigate the response of terrestrial organisms to changes in their environment The volume comprises an introductory and a final chapter by the editors as well as another 35 contributions These are divided into six sections 1 past environmental changes the late

Quaternary 2 spatial responses to past changes 3 mechanisms enabling spatial responses 4 evolutionary responses to past changes 5 mechanisms enabling evolutionary responses 6 predicted future environmental changes and simulated responses

The overwhelming and unanimous conclusion of all contributors is that forecasted global environmental changes pose a severe threat to the integrity of ecosystems worldwide and to the survival of at least some species
