

The book cover features a stylized, painterly illustration. In the foreground, a woman with long brown hair lies on her back on a grey surface, wearing a vibrant red dress. Her face is pale with dark, expressive lines for features, and her hands are clasped near her head. In the background, a cityscape is depicted with white buildings and a prominent white tower, set against a green landscape and a blue sky. The overall style is reminiscent of modernist or expressionist art.

Energy Transfers in Atmosphere and Ocean Carsten Eden, Armin Iske, 2019-01-23 This book describes a recent effort combining interdisciplinary expertise within the Collaborative Research Centre Energy transfers in atmosphere and ocean TRR 181 which was funded by the German Research Foundation DFG Energy transfers between the three dynamical regimes small scale turbulence internal gravity waves and geostrophically balanced motion are fundamental to the energy cycle of both the atmosphere and the ocean Nonetheless they remain poorly understood and quantified and have yet to be adequately represented in today's climate models Since interactions between the dynamical regimes ultimately link the smallest scales to the largest ones through a range of complex processes understanding these interactions is essential to constructing atmosphere and ocean models and to predicting the future climate To this end TRR 181 combines expertise in applied mathematics meteorology and physical oceanography This book provides an overview of representative specific topics addressed by TRR 181 ranging from a review of a coherent hierarchy of models using consistent scaling and approximations and revealing the underlying Hamiltonian structure a systematic derivation and implementation of stochastic and backscatter parameterisations an exploration of the dissipation of large scale mean or eddying balanced flow and ocean eddy parameterisations and a study on gravity wave breaking and mixing the interaction of waves with the mean flow and stratification wave wave interactions and gravity wave parameterisations to topics of a more numerical nature such as the spurious mixing and dissipation of advection schemes and direct numerical simulations of surface waves at the air sea interface In TRR 181 the process oriented topics presented here are complemented by an operationally oriented synthesis focusing on two climate models currently being developed in Germany In this way the goal of TRR 181 is to help reduce the biases in and increase the accuracy of atmosphere and ocean models and ultimately to improve climate models and climate predictions

Turbulence in the Ocean Monin, Ozmidov, 2012-12-06 Four years have elapsed since the preparation of the original Russian version of this book This is a long time when dealing with such actively expanding fields of oceanography as research into small scale structures and the investigation of hydro physical processes Over this period new quick response devices have been developed and successfully used for measurements taken in various ocean areas Improvements in high frequency meters used to measure hydrophysical parameters has enabled workers to obtain more accurate absolute values of the fluctuations measured by such devices In view of this scientific progress some of the ideas presented in this book now require additional explanation Great care should be used in dealing with the absolute fluctuation values of hydro physical fields since the methods used for the determination of the accuracy of the high frequency measuring devices have been imperfect in the past Nevertheless it would appear that the results of the investigations

summarized in this book have not lost their importance and that the established laws governing small scale processes in the ocean are of a sufficiently universal nature and as such have not been shattered with the qualitative and quantitative advances in devices used for measurements taken in oceans The authors feel that their work is of interest to English speaking readers The appearance of the English translation of the book is to a very large extent due to the tremendous amount of editing work brilliantly done by Prof H Tennekes

Computational Methods for the Atmosphere and the Oceans
 Roger Temam, Joe Tribbia, 2009-06-16 This book provides a survey of the frontiers of research in the numerical modeling and mathematical analysis used in the study of the atmosphere and oceans The details of the current practices in global atmospheric and ocean models the assimilation of observational data into such models and the numerical techniques used in theoretical analysis of the atmosphere and ocean are among the topics covered Truly interdisciplinary scientific interactions between specialties of atmospheric and ocean sciences and applied and computational mathematics Uses the approach of computational mathematicians applied and numerical analysts and the tools appropriate for unsolved problems in the atmospheric and oceanic sciences Contributions uniquely address central problems and provide a survey of the frontier of research

Numerical Models of Oceans and Oceanic Processes Lakshmi H. Kantha, Carol Anne Clayson, 2000-08-08 Oceans play a pivotal role in our weather and climate Ocean borne commerce is vital to our increasingly close knit global community Yet we do not fully understand the intricate details of how they function how they interact with the atmosphere and what the limits are to their biological productivity and their tolerance to wastes While satellites are helping us to fill in the gaps numerical ocean models are playing an important role in increasing our ability to comprehend oceanic processes monitor the current state of the oceans and to a limited extent even predict their future state Numerical Models of Oceans and Oceanic Processes is a survey of the current state of knowledge in this field It brings together a discussion of salient oceanic dynamics and processes numerical solution methods and ocean models to provide a comprehensive treatment of the topic Starting with elementary concepts in ocean dynamics it deals with equatorial mid latitude high latitude and coastal dynamics from the perspective of a modeler A comprehensive and up to date chapter on tides is also included This is followed by a discussion of different kinds of numerical ocean models and the pre and post processing requirements and techniques Air sea and ice ocean coupled models are described as well as data assimilation and nowcast forecasts Comprehensive appendices on wavelet transforms and empirical orthogonal functions are also included This comprehensive and up to date survey of the field should be of interest to oceanographers atmospheric scientists and climatologists While some prior knowledge of oceans and numerical modeling is helpful the book includes an overview of enough elementary material so that along with its companion volume Small Scale Processes in Geophysical Flows it should be useful to both students new to the field and practicing professionals Comprehensive and up to date review Useful for a two semester or one semester on selected topics graduate level course Valuable reference on the topic Essential for a better understanding of weather and climate

Atmospheric and Oceanic Fluid Dynamics Geoffrey K. Vallis, 2017-06-08 This second edition now in full color provides a unified and comprehensive treatment of the atmosphere and ocean for advanced students and researchers

Nonlinear Climate Dynamics Henk A. Dijkstra, 2013-06-17 This book introduces stochastic dynamical systems theory in order to synthesize our current knowledge of climate variability Nonlinear processes such as advection radiation and turbulent mixing play a central role in climate variability These processes can give rise to transition phenomena associated with tipping or bifurcation points once external conditions are changed The theory of dynamical systems provides a systematic way to study these transition phenomena Its stochastic extension also forms the basis of modern nonlinear data analysis techniques predictability studies and data assimilation methods Early chapters apply the stochastic dynamical systems framework to a hierarchy of climate models to synthesize current knowledge of climate variability Later chapters analyse phenomena such as the North Atlantic Oscillation El Niño Southern Oscillation Atlantic Multidecadal Variability Dansgaard Oeschger events Pleistocene ice ages and climate predictability This book will prove invaluable for graduate students and researchers in climate dynamics physical oceanography meteorology and paleoclimatology

Frontiers in Turbulence and Coherent Structures J. P. Denier, Jorgen S. Frederiksen, 2007 The Chickasaw Nation an American Indian nation headquartered in southeastern Oklahoma entered into a period of substantial growth in the late 1980s Following its successful reorganization and expansion which was enabled by federal policies for tribal self determination the Nation pursued gaming and other industries to affect economic growth From 1987 to 2009 the Nation's budget increased exponentially as tribal investments produced increasingly large revenues for a growing Chickasaw population Coincident to this growth the Chickasaw Nation began acquiring and creating museums and heritage properties to interpret their own history heritage and culture through diverse exhibitionary representations By 2009 the Chickasaw Nation directed representation of itself at five museum and heritage properties throughout its historic boundaries Josh Gorman examines the history of these sites and argues that the Chickasaw Nation is using museums and heritage sites as places to define itself as a coherent and legitimate contemporary Indian nation In doing so they are necessarily engaging with the shifting historiographical paradigms as well as changing articulations of how museums function and what they represent The roles of the Chickasaw Nation's museums and heritage sites in defining and creating discursive representations of sovereignty are examined within their historicized local contexts The work describes the museum exhibitions dialogue with the historiography of the Chickasaw Nation the literature of new museum studies and the indigenous exhibitionary grammars emerging from indigenous museums throughout the United States and the world

Lost Land of the Dodo Anthony Cheke, Julian P. Hume, 2009-01-01 The Mascarene islands in the southern Indian Ocean Mauritius Reunion and Rodrigues were once home to an extraordinary range of birds and reptiles Evolving on these isolated volcanic

islands in the absence of mammalian predators or competitors the land was dominated by giant tortoises parrots skinks and geckos burrowing boas flightless rails the birds and tortoises were slaughtered indiscriminately while introduced rats cats pigs and monkeys destroyed their eggs the once extensive forests logged and invasive introduced plants from all over the tropics devastated the ecosystem The now familiar icon of extinction the Dodo was gone from Mauritius within 50 years of human settlement and over the next 150 years many of the Mascarenes other native vertebrates followed suit The product of over 30 years research by Anthony Cheke *Lost Land of the Dodo* provides a comprehensive yet hugely enjoyable account of the story of the islands changing ecology interspersed with human stories the islands biogeographical anomalies and much else Many French publications old and new especially for Reunion are discussed and referenced in English for the first time The book is richly illustrated with maps and contemporary illustrations of the animals and their environment many of which have rarely been reprinted before Illustrated box texts look in detail at each extinct vertebrate species while Julian Hume's superb colour plates bring many of the extinct birds to life *Lost Land of the Dodo* provides the definitive account of this tragic yet remarkable fauna and is a must read for anyone interested in islands their ecology and the history of our relationship with the world around us

Climate, Planetary and Evolutionary Sciences Guido Visconti, 2021-04-14 This book presents the result of an innovative challenge to create a systematic literature overview driven by machine generated content Questions and related keywords were prepared for the machine to query discover collate and structure by Artificial Intelligence AI clustering The AI based approach seemed especially suitable to provide an innovative perspective as the topics are indeed both complex interdisciplinary and multidisciplinary for example climate planetary and evolution sciences Springer Nature has published much on these topics in its journals over the years so the challenge was for the machine to identify the most relevant content and present it in a structured way that the reader would find useful The automatically generated literature summaries in this book are intended as a springboard to further discoverability They are particularly useful to readers with limited time looking to learn more about the subject quickly and especially if they are new to the topics Springer Nature seeks to support anyone who needs a fast and effective start in their content discovery journey from the undergraduate student exploring interdisciplinary content to Master or PhD thesis developing research questions to the practitioner seeking support materials this book can serve as an inspiration to name a few examples It is important to us as a publisher to make the advances in technology easily accessible to our authors and find new ways of AI based author services that allow human machine interaction to generate readable usable collated research content
