7 Failure Modes and Effects Analysis (FMEA) (2015)

A failure modes and effects analysis (FMEA) is to be carried out on the jacking system and holding mechanism with the purpose of demonstrating that a single failure of any component will not cause an uncontrolled descent of the unit. The FMEA methodology has to ensure that any predictable failure mode relevant to the purpose of the FMEA has been considered and is to be sufficiently detailed to cover all systems associated with the jacking and holding operations. The FMEA is to be submitted for review and is to include but not be limited to the following information:

- A description of all the systems associated with the jacking and holding operations of the unit and a functional block diagram showing their interaction with each other. Such systems would include the jacking systems, the fixation systems, jackcase, electrical power distribution system, hydraulic power system, control systems (including programmable systems and their physical components such as programmable logic controllers, network hubs, cards, buses, cabling, encoders, and interfaces/ displays), monitoring and alarm systems, etc. and their subcomponents.
- All significant failure modes relevant to the purpose of the FMEA
- Each predictable cause associated with each failure mode
- The method of detecting that the failure has occurred
- The effect of the failure upon the rest of the system's ability to jack the unit, including time effects (i.e., if necessary time is available for manual intervention)
- An analysis of possible common failure modes

Where parts of the system are identified as non-redundant and where redundancy is not possible, these parts are to be further studied with consideration given to their reliability and mechanical protection. The results of this further study are to be submitted for review.
