The integument plays an important role in the survival of meta zoans by separating and protecting them from a hostile environment Its function ranges from protection against injury and infection participation in the regulation of body temperature and water balance to respiratory activity monitoring of the environment and production of signals related to behaviour All these result from specific structural biochemical and physiological properties of intra and extracellular components of the integument Thus its characterization can be best accomplished by a multidisciplinary approach with authors specialized in different fields of science This multi author book in two volumes provides an up to date survey of the literature The first volume deals with the integument of invertebrates the second with that of vertebrates both organized primarily on a phylum basis As the level of knowledge on the integument of phyla differs considerably the information provided is correspondingly either limited or condensed For some of the smaller groups of invertebrates little information is available as often only a few electron micrographs are to be found in the literature on the other hand from the large body of knowledge existing for vertebrates particularly for mammals no complete overview can be provided but publications giving access to further information have been reviewed critically
