**Real Time Computing** Alexander D. Stoyenko, 2013-12-14 NATO s Division of Scientific and Environmental Affairs sponsored this Advanced Study Institute because it was felt to be timely to cover this important and challenging subject for the first time in the framework of NATO s ASI programme The significance of real time systems in everyones life is rapidly growing The vast spectrum of these systems can be characterised by just a few examples of increasing complexity controllers in washing machines air traffic control systems control and safety systems of nuclear power plants and finally future military systems like the Strategic Defense Initiative SDI The importance of such systems for the well being of people requires considerable efforts in research and development of highly reliable real time systems Furthermore the competitiveness and prosperity of entire nations now depend on the early application and efficient utilisation of computer integrated manufacturing systems CIM of which real time systems are an essential and decisive part Owing to its key significance in computerised defence systems real time computing has also a special importance for the Alliance The early research and development activities in this field in the 1960s and 1970s aimed towards improving the then unsatisfactory software situation Thus the first high level real time languages were defined and developed RTL 2 Coral 66 Procol LTR and PEARL In close connection with these language developments and with the utilisation of special purpose process control peripherals the research on real time operating systems advanced considerably

**Computing in Anesthesia and Intensive Care** Omar Prakash, 2012-12-06 There is a tendency of an increasing number of signals and derived variables to be incorporated in the monitoring of patients during anesthesia and in intensive care units The addition of new signals hardly ever leads to the deletion of other signals This is probably based on a feeling of insecurity We must realize that each new signal that is being monitored brings along its cost in terms of risk to the patient investment and time It is therefore essential to assess the relative contribution of this new signal to the quality of the monitoring process i e given the set of signals already in use what is the improvement when a new signal is added Beyond a certain point the addition of new information leads to new

uncertainty and degrades the result Ream 1981 In the diagnostic process it is possible to evaluate result in an objective qualitative way The changes in the sensitivity and specificity of the diagnosis as a result of the addition or deletion of a certain variable can be calculated on the basis of false negative false positive correct negative and false negative scores Different methods for multiple regression analysis have been implemented on computers Gelsema 1981 which can support such decision processes In monitoring the situation is much more complex Many definitions of monitoring have been given the common denominator is that monitoring is a continuous diagnostic process based upon a semi continuous flow of information This makes simple assessment methods useless
