Sochor, A. Righetti, M.G. Niemeyer, 2012-12-06. Since the introduction of myocardial perfusion imaging and radionuclide angiography in the mid seventies, cardiovascular nuclear medicine has undergone an explosive growth. The use of nuclear cardiology techniques has become one of the cornerstones of the noninvasive assessment of coronary artery disease. In the

past 15 years major steps have been made from visual analysis to quantitative analysis from planar imaging to tomographic imaging from detection of disease to prognosis and from separate evaluations of perfusion metabolism and function to an integrated assessment of myocardial viability In recent years many more advances have been made in cardiovascular nuclear imaging such as the development of new imaging agents reevaluation of existing procedures and new clinical applications This book describes the most recent developments in nuclear cardiology and also addresses new contrast agents in MRI

What's New in Cardiac Imaging will assist the clinical cardiologist the cardiology fellow the nuclear medicine physician and the radiologist in understanding the most recent achievements in clinical cardiovascular nuclear imaging Drugs Looking for Diseases R. Vos, 2012-12-06 We all know how much time effort and money it takes to develop a new drug Hundreds of chemical compounds have to be synthesized and thousands of different activities in biology physiology pharmacology clinical investigation management and marketing have to be initiated and coordinated Each new drug starts a voyage of discovery through an unmapped terrain which is shrouded in mist and beset by pitfalls as Dr Rein Vos puts it in his absorbing inside story of the development of the beta adrenoceptor blocking agents and the calcium antagonists Indeed we know for example how long it took before the theory of Ahlquist of the alpha and beta adrenergic receptors was widely accepted Similarly it suffices to memorize shortly the difficulty of expanding the new concept of calcium antagonism through the national German boundaries into the world This shows how laborious and complex pharmaceutical progress is and we all will benefit from a deeper understanding of the process of innovative drug research The Heart in Hypertension Michel Emile Safar, F. Fouad-Tarazi, 2012-12-06 Hypertension is the major cause of left ventricular hypertrophy While the electrocardiogram is an extremely insensitive measure of anatomic left ventricular hypertrophy it provides a time tested important marker of an adverse cardiovascular outcome There has been a recent temporal decrease in the incidence of electrocardiographic evidence of LVH even within the hypertensive population no doubt this is the result of large antihypertensive treatment experts Anatomical evidence of left ventricular hypertrophy is best documented pre morbidly using echocardiographic techniques It therefore appears that between 20 and 50 percent of the hypertensive population has left ventricular hypertrophy by echocardiographic techniques The prognostic significance of the echocardiographically determined increase in left ventricular mass is just beginning to be evaluated Early information suggests that there is an increased rate of cardiovascular morbidity in patients with echocardiographic evidence of increased left ventricular mass However this information is only preliminary and as yet only a limited number of events have been reported Far more supporting information will be required before the full impact of echocardiographically detected left ventricular hypertrophy can be determined Nevertheless it must be stated that the electrocardiogram still has the greatest predictive value of cardiovascular morbid and mortal events when the pattern of left ventricular hypertrophy plus repolarization abnormalities are present **Quality of Life after Open Heart Surgery** Paul J. Walter, 1992 The technical evolution of cardiac surgery in the last decades has been

rewarded with long term survival with few complications A matching improvement in the quality of this survival as subjectively felt by the patient has now become the most important to assess the justification of surgery
