Advances in Intelligent Systems

S.G. Tzafestas,2013-12-01 Intelligent Systems involve a large class of systems which posses human like capabilities such as learning observation perception interpretation reasoning under uncertainty planning in known and unknown environments decision making and control action The field of intelligent systems is actually a new interdisciplinary field which is the outcome of the interaction cooperation and synergetic merging of classical fields such as system theory control theory artificial intelligence information theory operational research soft computing communications linguistic theory and others Integrated intelligent decision and control systems involve three primary hierarchical levels namely organization coordination and execution levels As we proceed from the be performed organization to the execution level the precision about the jobs to increases and accordingly the intelligence required for these jobs decreases This is in compliance with the principle of increasing precision with decreasing intelligence IPOI known from the management field and theoretically established by Saridis using information theory concepts This book is concerned with intelligent systems and techniques and gives emphasis on the computational and processing issues Control issues are not included here The contributions of the book are presented in four parts as follows

Methods and Applications of Intelligent Control

S.G. Tzafestas,2012-12-06 This book is concerned with Intelligent Control methods and applications The field of intelligent control has been expanded very much during the recent years and a solid body of theoretical and practical results are now available These results have been obtained through the synergetic fusion of concepts and techniques from a variety of fields such as automatic control systems science computer science neurophysiology and operational research Intelligent control systems have to perform anthropomorphic tasks fully autonomously or interactively with the human under known or unknown and uncertain environmental conditions Therefore the basic components of any intelligent control system include cognition perception learning sensing planning numeric and symbolic processing fault detection repair reaction and control action These components must be linked in a systematic synergetic and efficient way Predecessors of intelligent control are adaptive control self organizing control and learning control which are well documented in the literature Typical application

examples of intelligent controls are intelligent robotic systems intelligent manufacturing systems intelligent medical systems and intelligent space teleoperators Intelligent controllers must employ both quantitative and qualitative information and must be able to cope with severe temporal and spatial variations in addition to the fundamental task of achieving the desired transient and steady state performance Of course the level of intelligence required in each particular application is a matter of discussion between the designers and users The current literature on intelligent control is increasing but the information is still available in a sparse and disorganized way *Remote Manipulation Systems* L.I. Slutski,2012-12-06 A famous French writer Anatole France liked to say The future is a convenient place to position our dreams 1927 Indeed this remark gains full meaning when one considers the history of what we call today Robotics For more than 3000 years mankind has dreamt of the possibility of artificial machines that would have all the advantages of human slaves without any of their drawbacks With the developments in technology since the end of World War II mainly with the explosive progress of computers it was thought we might at last succeed in transforming this everlasting dream into reality In the mind of scientists of the 1950 s to make such intelligent and autonomous machines before the year 2000 seemed a small challenge it was obvious thanks to computers and Artificial Intelligence But in spite of progress in some directions we must admit that the dream remains a dream and that the basic problems denying us a successful issue are not solved In fact if we except industrial robots only calling for classical automata theory the main advanced result concerning autonomous and intelligent machines is related to some understanding of reasons why we have failed during the past years **Advances in Intelligent Autonomous Systems** S.G.

Tzafestas,2012-12-06 The field of Intelligent Autonomous Systems IAS has attracted over the years the attention of numerous research and industrial groups and has by now arrived at an advanced level of development The results have been achieved through the synergetic use of concepts techniques and technologies drawn from electrical and mechanical engineering control engineering systems science computer science and management science Currently the majority of working systems in practice are of the semi autonomous type needing some level of human intervention Therefore much effort is presently devoted in academic research and industrial environments towards further increasing the level of autonomy This book provides a collection of essays which cover the latest research in the IAS field and present a rich set of results accompanied by detailed descriptions of the relevant concepts tools techniques and hardware software designs The book contains twenty three chapters grouped in the following parts Part 1 General concepts architectures and technologies Part 2 Mobile walking and snake like robots Part 3 Applications PART 1 involves the first seven chapters which deal with generic issues Chapter 1 by S G Tzafestas provides some background material accompanied by a description of two research IAS prototypes namely a car disassembly robotic system and a semi autonomous autonomous robotic wheelchair Chapter 2 by G Bolmsjo M Olsson and K Brink presents a generic event based control system structure for the control of a robotic workcell including its implementation where the autonomous operation is achieved via reactive replanning and configurable corrections
