Architectures for Product Families Frank van der Linden, 2003-08-06 This book originates from a workshop organised by ESPRIT project 20 477 ARES in Las Palmas de Gran Canaria Spain February 1998 ARES is an acronym for Architectural Reasoning for Embedded Systems Within this project we investigate techniques to deal with problems of software architecture of families of embedded systems It is the second workshop organised by this project Its predecessor was held in Las Navas de Marques Spain November 1996 The proceedings of the first workshop are only available in electronic format at <http://www.dit.upm.es/ares> The second workshop succeeded even more than the first one in gathering many of the most prominent people working in the area of software architecture for product families or product lines This second workshop consisted of six sessions The first session was meant to report the ARES results according to the topics of the next five sessions The remaining sessions dealt with different aspects of software architecture focussed on applications for product families or product lines Because there will be a separate book covering all ARES results the first session is not included in this book The workshop was chaired by Henk Obbink from Philips Research and Paul Clements from the Software Engineering Institute at Carnegie Mellon University They prepared and presented an overall conclusion at the end of the workshop This conclusion was used in the introduction to this book

Distributed Computer Control Systems 1998 (DCCS '98) International Federation of Automatic Control, 1999 Computer control systems are increasingly required to be highly dependable and to have deterministic timing properties Distributed architectures have the potential to meet this challenge The advantages of distributed computer control systems include the possibility of composing large systems out of pre tested components with small integration effort their well defined fault containment properties and their capacity to make effective use of mass produced silicon chips The IFAC Workshop series on Distributed Computer Control Systems DCCS highlights and

traces the growth of key concepts in this field at their various stages of development Theoretical and practice oriented viewpoints receive equal emphasis and there is a creative blending of the disciplines of computer science and control engineering The 1998 DCCS Workshop was notable for the attention given to true real time communication networks and protocols The complexity of the trade off between services dependability mechanisms and system level properties was highlighted and rigorous modelling and analysis methodologies were discussed Event triggered and time triggered protocols were contrasted Models for analysing and predicting response times in distributed systems and for predicting the effect of response time jitter on the performance of feedback control loops were presented The application of formal methods to the specification and development of safety critical control software also received much attention Distributed object methodologies and object request brokers were also highlighted as being promising approaches for the programming of large scale heterogeneous distributed systems Applications reported included control systems for traffic lights jet engines automobiles fully automatic trains and flexible manufacturing systems

Mobile Object Systems Towards the Programmable Internet Jan Vitek, 1997-04-02 If the Internet is seen as a single vast programmable machine what is the proper programming paradigm to facilitate development of the new applications it must offer This state of the art survey deals with this question The situation we face is similar to that in the 1960s when a new hardware software architecture was introduced and it took some time for the programming language and operating system specialists to come up with the proper programming paradigms Now we have the new and exciting paradigm of mobile computing where computations are not bound to single locations but may move around at will to best use the available computer network resources This paradigm will have a profound impact on the way distributed applications in particular Internet applications are designed and implemented
