**Recent Trends in Animal Nutrition and Feed Technology for Livestock, Pets and Laboratory Animals** D. N. Pandey, D.N. & Bajpai, 2003      Critical Role of Animal Science Research in Food Security and Sustainability National Research Council, Division on Earth and Life Sciences, Board on Agriculture and Natural Resources, Policy and Global Affairs, Science and Technology for Sustainability Program, Committee on Considerations for the Future of Animal Science Research, 2015-03-31 By 2050 the world's population is projected to grow by one third reaching between 9 and 10 billion. With globalization and expected growth in global affluence, a substantial increase in per capita meat, dairy, and fish consumption is also anticipated. The demand for calories from animal products will nearly double, highlighting the critical importance of the world's animal agriculture system. Meeting the nutritional needs of this population and its demand for animal products will require a significant investment of resources as well as policy changes that are supportive of agricultural production. Ensuring sustainable agricultural growth will be essential to addressing this global challenge to food security. Critical Role of Animal Science Research in Food Security and Sustainability identifies areas of research and development, technology, and resource needs for research in the field of animal agriculture both nationally and internationally. This report assesses the global demand for products of animal origin in 2050 within the framework of ensuring global food security, evaluates how climate change and natural resource constraints may impact the ability to meet future global demand for animal products in sustainable production systems, and identifies factors that may impact the ability of the United States to meet demand for animal products, including the need for trained human capital, product safety and quality, and effective communication and adoption of new knowledge, information, and technologies. The agricultural sector worldwide faces numerous daunting challenges that will require innovations, new technologies, and new ways of approaching agriculture if the food, feed, and fiber needs of the global population are to be met. The recommendations of Critical Role of Animal Science Research in Food Security and Sustainability will inform a new roadmap for animal science research to meet the challenges of sustainable animal production in the 21st century.      *Probiotic in Animals* Everlon Rigobelo, 2012-10-03 Over the last few decades, the prevalence of studies about probiotics strains has dramatically grown in most regions of the world. The use of probiotics strains in animal production may reduce several problems caused by antibiotics therapy, growth promoter, and problems from inadequate management. Probiotics are specific strains of microorganisms which, when served to human or animals in proper amount, have a beneficial effect, improving health or reducing risk of getting sick. This book provides the maximum of information for all that need them, trying with this to help many people worldwide.      Bibliography of Agriculture, 1976      **The Effects on Human Health of Subtherapeutic Use of Antimicrobials in Animal Feeds** National Research Council, Division on Earth and Life Studies, Division of Medical Sciences, Commission on Life Sciences, Committee to Study the Human Health Effects of Subtherapeutic Antibiotic Use in Animal Feeds, 1980-02-01

**Animal Nutrition** Philip Hynd, 2019-11-01 Nutrition is the key driver of animal health welfare and production. In agriculture, nutrition is crucial to meet increasing global demands for animal protein and consumer demands for cheaper meat, milk, and eggs and higher standards of animal welfare. For companion animals, good nutrition is essential for quality and length of life. *Animal Nutrition* examines the science behind the nutrition and feeding of the major domesticated animal species: sheep, beef cattle, dairy cattle, deer, goats, pigs, poultry, camelids, horses, dogs, and cats. It includes introductory chapters on digestion and feeding standards, followed by chapters on each animal containing information on digestive anatomy and physiology, evidence-based nutrition and feeding requirements, and common nutritional and metabolic diseases. Clear diagrams, tables, and breakout boxes make this text readily understandable, and it will be of value to tertiary students and to practising veterinarians, livestock consultants, producers, and nutritionists.

**To Feed a Nation** Keith Thomas Henry Farrer, 2005 Takes the reader on a journey over the centuries describing the slow and arduous development of Australian food technology and science from before European settlement to the latter half of the twentieth century.

**Tackling Climate Change Through Livestock** Food and Agriculture Organization of the United Nations, 2013 Greenhouse gas emissions by the livestock sector could be cut by as much as 30 percent through the wider use of existing best practices and technologies. FAO conducted a detailed analysis of GHG emissions at multiple stages of various livestock supply chains, including the production and transport of animal feed, on-farm energy use, emissions from animal digestion and manure decay, as well as the post-slaughter transport, refrigeration, and packaging of animal products. This report represents the most comprehensive estimate made to date of livestock's contribution to global warming, as well as the sector's potential to help tackle the problem. This publication is aimed at professionals in food and agriculture, as well as policy makers.

*Trends in Dietary Carbohydrates Research* M. V. Landow, 2006 Carbohydrates are present in food comprising of digestible sugars and starches and indigestible cellulose and other dietary fibres. The former are the major source of energy. The sugars are in beet and cane sugar, fruits, honey, sweet corn, corn syrup, milk, and milk products, etc. The starches are in cereal grains, legumes, tubers, etc. In patients with hepatic forms of porphyria, a person should consume at least 350 mg of carbohydrate per day, or the carbohydrates should make up 60-65 per cent of the daily consumption. This book examines and presents new research of the complexity, effects, and nutritional aspects of dietary carbohydrates.

**Probiotics, Prebiotics, and Synbiotics** Ronald Ross Watson, Victor R. Preedy, 2015-10-08 Probiotics, Prebiotics, and Synbiotics: Bioactive Foods in Health Promotion reviews and presents new hypotheses and conclusions on the effects of different bioactive components of probiotics, prebiotics, and synbiotics to prevent disease and improve the health of various populations. Experts define and support the actions of bacteria, modified bioflavonoids, and prebiotic fibrous materials and vegetable compounds. A major emphasis is placed on the health-promoting activities and bioactive components of probiotic bacteria. Offers a novel focus on synbiotics: carefully designed prebiotics-probiotics combinations to help design functional food and nutraceutical products. Discusses

how prebiotics and probiotics are complementary and can be incorporated into food products and used as alternative medicines Defines the variety of applications of probiotics in health and disease resistance and provides key insights into how gut flora are modified by specific food materials Includes valuable information on how prebiotics are important sources of micro and macronutrients that modify body functions

**Science Breakthroughs to Advance Food and Agricultural Research by 2030** National Academies of Sciences, Engineering, and Medicine, Division of Behavioral and Social Sciences and Education, Board on Environmental Change and Society, Health and Medicine Division, Food and Nutrition Board, Division on Earth and Life Studies, Water Science and Technology Board, Board on Life Sciences, Board on Atmospheric Sciences and Climate, Board on Agriculture and Natural Resources, Committee on Science Breakthroughs 2030: A Strategy for Food and Agricultural Research, 2019-04-21 For nearly a century scientific advances have fueled progress in U S agriculture to enable American producers to deliver safe and abundant food domestically and provide a trade surplus in bulk and high value agricultural commodities and foods Today the U S food and agricultural enterprise faces formidable challenges that will test its long term sustainability competitiveness and resilience On its current path future productivity in the U S agricultural system is likely to come with trade offs The success of agriculture is tied to natural systems and these systems are showing signs of stress even more so with the change in climate More than a third of the food produced is unconsumed an unacceptable loss of food and nutrients at a time of heightened global food demand Increased food animal production to meet greater demand will generate more greenhouse gas emissions and excess animal waste The U S food supply is generally secure but is not immune to the costly and deadly shocks of continuing outbreaks of food borne illness or to the constant threat of pests and pathogens to crops livestock and poultry U S farmers and producers are at the front lines and will need more tools to manage the pressures they face Science Breakthroughs to Advance Food and Agricultural Research by 2030 identifies innovative emerging scientific advances for making the U S food and agricultural system more efficient resilient and sustainable This report explores the availability of relatively new scientific developments across all disciplines that could accelerate progress toward these goals It identifies the most promising scientific breakthroughs that could have the greatest positive impact on food and agriculture and that are possible to achieve in the next decade by 2030
