Recent Progress In Failing Heart Syndrome:

Recent Progress in Failing Heart Syndrome Shigetake Sasayama, Hiroyuki Suga, 2012-12-06 Heart failure is a syndrome caused by a heart dysfunction that leads to insufficient blood in the peripheral tissues for their metabolic demands. This syndrome still remains an obscure clinical entity and even its definition is disputed. It has become increasingly apparent that heart failure may relate not only to cardiac dysfunction but also to other physiological alterations involved in the maintenance of circulatory homeostasis. In 1988 the Japanese Circulation Society organized a three year project for research on heart failure. The research group consisted of ten investigators all relatively young but well recognized internationally for their research accomplishments. This book represents a compilation of the achievements by this group during the past three years which have led to new insights into the pathophysiologic mechanisms of heart failure and diagnosis, evaluation and treatment of this syndrome. Contents include research into the cellular biology of congestive heart failure and a framework of pressure volume relationships enabling assessment of ventricular contraction energetics or coupling of ventricular properties and arterial load. This conceptual framework is of vital significance particularly when we consider the failing heart as an energy depleted state. An understanding of the neuroendocrine responses to explain the pathophysiology of congestive heart failure is perhaps the most important advance and has led to new developments in therapy. This book also includes an analysis of mechanical factors including both regional and global ventricular functions and this is related to the understanding of the pathophysiology of congestive heart failure.

From Hypertension to Heart Failure Michael Böhm, John H. Laragh, Manfred Zehender, 2012-12-06 Arterial hypertension, coronary heart disease and heart failure are the commonest cardiovascular conditions to present in clinical practice. Over the past few years it has become increasingly clear that they are closely and causally interrelated and that their relationship can have a significant bearing on prognosis. Epidemiological studies have shown that arterial hypertension is one of the most important risk factors for developing heart failure. Only one in four patients with hypertension is adequately managed and in 50% of cases the hypertension has not been recognised or treated. Patients with pre-existing hypertension who go on to suffer an acute myocardial infarction have usually not previously had typical angina symptoms; the infarct territory is larger, life threatening arrhythmias are commoner and hence in-hospital mortality and long term prognosis are markedly worse. The presence of raised blood pressure in the post-infarct phase doubles the risk of manifest heart failure. The close relationship between hypertension, coronary heart disease and heart failure makes the choice of therapeutic strategy particularly important. Agents and classes of agents that have prognostic value in all three conditions should be considered first as synergy might result in additional benefits. In such patients this sort of therapeutic decision making might have further advantages. The use of these agents may prevent complications which are not yet clinically obvious such as heart failure.

New Horizons for Failing Heart Syndrome Shigetake Sasayama, 2012-12-06 New Horizons for Failing Heart Syndrome brings together the latest knowledge on heart

failure syndrome and the status of research on heart failure in Japan compiling the results of the Japanese Circulation Society's second research series Contents include the molecular mechanism of heart failure mechanics of contraction of the failing heart energetics of the failing heart exercise physiology and new aspects of management of heart failure The Japanese Circulation Society's 3 year project for research on heart failure was conducted in two series the first from 1988 to 1991 and the second from 1992 to the spring of 1995 The present volume embodies the most up to date overview of current research being carried out in Japan today and will be of special interest to cardiologists researchers and other practitioners in the field
