**Molecular Mechanisms in Yeast Carbon Metabolism** Jure Piškur,Concetta Compagno,2014-05-06 Yeast is one of the most studied laboratory organisms and represents one of the most central models to understand how any eukaryote cell works On the other hand yeast fermentations have for millennia provided us with a variety of biotech products like wine beer

vitamins and recently also with pharmaceutically active heterologous products and biofuels A central biochemical activity in the yeast cell is the metabolism of carbon compounds providing energy for the whole cell and precursors for any of the final fermentation products A complex set of genes and regulatory pathways controls the metabolism of carbon compounds from nutrient sensing signal transduction transcription regulation and post transcriptional events Recent advances in comparative genomics and development of post genomic tools have provided further insights into the network of genes and enzymes and molecular mechanisms which are responsible for a balanced metabolism of carbon compounds in the yeast cell and which could be manipulated in the laboratory to increase the yield and quality of yeast biotech products This book provides a dozen of most comprehensive reviews on the recent developments and achievements in the field of yeast carbon metabolism from academic studies on gene expression to biotechnology relevant topics

**The Evolution of Senescence in the Tree of Life** Richard P. Shefferson, Owen R. Jones, Roberto Salguero-Gómez, 2017-02-23 The existing theories on the evolution of senescence assume that senescence is inevitable in all organisms However recent studies have shown that this is not necessarily true A better understanding of senescence and its underlying mechanisms could have far reaching consequences for conservation and eco evolutionary research This book is the first to offer interdisciplinary perspectives on the evolution of senescence in many species setting the stage for further developments It brings together new insights from a wide range of scientific fields and cutting edge research done on a multitude of different animals including humans plants and microbes giving the reader a complete overview of recent developments and of the controversies currently surrounding the topic Written by specialists from a variety of disciplines this book is a valuable source of information for students and researchers interested in ageing and life history traits and populations

**Yeast Biotechnology: Diversity and Applications** T. Satyanarayana, Gotthard Kunze, 2009-04-24 I believe that the book would provide an overview of the recent developments in the domain of yeast research with some new ideas which could serve as an inspiration and challenge for researchers in this field New Delhi Prof Asis Datta Dec 24 2007 Former Vice chancellor JNU Director NCPGR New Delhi Preface Yeasts are eukaryotic unicellular microfungi that are widely distributed in the natural environments Although yeasts are not as ubiquitous as bacteria in the natural environments they have been isolated from terrestrial aquatic and atmospheric environments Yeast communities have been found in association with plants animals and insects Several species of yeasts have also been isolated from specialized or extreme environments like those with low water potential e g high sugar salt concentrations low temperature e g yeasts isolated from Antarctica and low oxygen availability e g intestinal tracts of animals Around 1500 species of yeasts belonging to over 100 genera have been described so far It is estimated that only 1% of the extant yeasts on earth have been described till date Therefore global efforts are underway to recover new yeast species from a variety of normal and extreme environments Yeasts play an important role in food chains and carbon nitrogen and sulphur cycles Yeasts can be genetically manipulated by hybridization mutation rare mating cytoduction spheroplast fusion single

chromosomal transfer and transfor tion using recombinant technology Yeasts e g **Yeast Stress Responses** Stefan Hohmann, Willem H. Mager, 2007-10-23 Every cell has developed mechanisms to respond to changes in its environment and to adapt its growth and metabolism to unfavorable conditions The unicellular eukaryote yeast has long proven as a particularly useful model system for the analysis of cellular stress responses and the completion of the yeast genome sequence has only added to its power This volume comprehensively reviews both the basic features of the yeast genral stress response and the specific adapations to different stress types nutrient depletion osmotic and heat shock as well as salt and oxidative stress It includes the latest findings in the field and discusses the implications for the analysis of stress response mechanisms in higher eukaryotes as well **Model Systems in Aging** Thomas Nyström, Heinz D. Osiewacz, 2004 Aging is the progressive decline in biological functions over time This decline targets macromolecules cells tissues and as a consequence whole organisms Despite considerable progress in the development of testable hypothesis concerning aging in an evolutionary context a unifying theory of the molecular physiological mechanistic causes of aging has not been reached In fact is it not clear to what extent aging is a programmed or stochastic process This book takes the reader from unicellular bacterial deterioration via senescence in fungi and worms to aging in rodents and humans allowing a comparative view on similarities and differences in different genetic model systems The different model systems are scrutinized in the light of contemporary aging hypothesis such as the free radical and genomic instability theories *Molecular Mechanisms and Physiological Significance of Organelle Interactions and Cooperation* Michael Schrader, Markus Islinger, 2017-02-28 Eukaryotic cells contain distinct membrane bound organelles which compartmentalise cellular proteins to fulfil a variety of vital functions Many organelles have long been regarded as isolated and static entities e g peroxisomes mitochondria lipid droplets but it is now evident that they display dynamic changes interact with each other share certain proteins and show metabolic cooperation and cross talk Despite great advances in the identification and characterisation of essential components and molecular mechanisms associated with the biogenesis and function of organelles information on how organelles interact and are incorporated into metabolic pathways and signaling networks is just beginning to emerge Organelle cooperation requires sophisticated targeting systems which regulate the proper distribution of shared proteins to more than one organelle Organelle motility and membrane remodeling support organelle interaction and contact This contact can be mediated by membrane proteins residing on different organelles which can serve as molecular tethers to physically link different organelles together They can also contribute to the exchange of metabolites and ions or act in the assembly of signaling platforms In this regard organelle communication events have been associated with important cellular functions such as apoptosis antiviral defense organelle division biogenesis ROS metabolism and signaling and various metabolic pathways such as breakdown of fatty acids or cholesterol biosynthesis In this research topic we will focus on recent novel findings on the underlying molecular mechanisms and physiological significance of organelle interaction and cooperation

with a particular focus on mitochondria peroxisomes endoplasmic reticulum lysosomes and lipid droplets and their impact on the regulation of cellular homeostasis Our understanding of how organelles physically interact and use cellular signaling systems to coordinate functional networks between each other is still in its infancy Nevertheless recent discoveries of defined membrane structures such as the mitochondria ER associated membranes MAM are revealing how membrane domains enriched in specific proteins transmit signals across organelle boundaries allowing one organelle to influence the function of another In addition to its role as a mediator between mitochondria and the ER contacts between the MAM and peroxisomes contribute to antiviral signaling and specialised regions of the ER are supposed to initiate peroxisome biogenesis whereas intimate contacts between peroxisomes lipid droplets and the ER mediate lipid metabolism In line with these observations it is tempting to speculate that further physical contact sites between other organelles exist Alternatively novel regulated vesicle trafficking pathways between organelles e g mitochondria to peroxisomes or lysosomes have been discovered implying another mode of organelle communication Identifying the key molecular players of such specialised membrane structures will be a prerequisite to understand how organelle communication is physically accomplished and will lead to the identification of new regulatory networks In addition to the direct transmission of interorganellar information cytosolic messenger systems e g kinase phosphatase systems or redox signaling may contribute to the coordination of organelle functions This research topic will integrate new findings from both modes of communication and will provide new perspectives for the functional significance of cross talk among organelles We would like to thank all the researchers who contributed their valuable work to this research topic Furthermore we are grateful to the reviewers and Associate Editors who contributed valuable comments and positive criticism to improve the contributions
