Advances in Rapid Sex-Steroid Action Gabriella Castoria,Antimo Migliaccio,2011-12-14 Breast and prostate cancers are both hormone dependent at least in some stages of their progression Hormonal manipulation represents an important therapeutic approach Although most of breast and prostate cancers initially respond to hormone therapy most tumors reinitiate to growth Finally hormone resistant and metastatic breast and prostate cancers may develop Thus the challenge is the dissection of mechanisms by which steroid receptor signaling pathways continue to influence cell growth and invasiveness Compelling evidence indicates that steroid hormones elicit non genomic responses in extra nuclear compartment of target cells In this cellular location steroid coupled receptors rapidly recruit signaling effectors or scaffold proteins and activate multiple pathways leading to proliferation survival migration and invasiveness The immediate challenge is the dissection of key events regulating the steroid response of target tissues to prevent progression and improve treatment of breast and prostate cancers **Journal of Rehabilitation Research & Development** ,2003 *Encyclopedia of*

Identities of Membrane Steroid Receptors Cheryl S. Watson,2012-12-06 Cheryl S Watson University o Texas Medical Branch Cellular steroid action has been thoroughly studied in the nuclear compartment However nuclear steroid receptor mechanisms have been unable to explain some of the rapid activities of steroids partiCularly those which occur in a time frame of seconds to minutes reviewed in 1 2 Based on these and other considerations an alternative membrane associated receptor form was long ago proposed to exist 3 Others interpret the location of the steroid receptors mediating these rapid effects as peri membrane or cytoplasmic New experimental tools have been brought to bear on the topic of receptors for steroids which mediate non genomic actions and thus investigative activity and focus regarding this type of steroid receptor has recently increased significantly However there may be multiple answers to the question how do steroids mediate rapid nongenomic effects Steroid actions initiated at the cell membrane can impinge on important phases in the lifespan of a cell proliferation migration differentiation and release of hormones or neurotransmitters functioning as signals to other cells
